INSTRUCTIONS

1. **Do not open this booklet until told to do so.**
2. Fill out the box in the upper right corner of this page.
3. This exam has 6 questions on 6 pages. Check to make sure that your exam is complete.
4. No book, paper or device other than usual writing instruments, this examination booklet, and a scientific calculator are allowed. **Calculators with graphing and/or symbolic computation capabilities are not allowed.**
5. **During the examination, speaking to, communicating with, or exposing written papers to the view of other examinees is forbidden.**
6. You may use the **reverse side of the previous page** for rough work or if you run out of space.
7. **You may lose marks if your explanations are incomplete or poorly presented.**
8. **Stop writing when you are instructed to do so. Failure to follow instructions may result in penalties.**

[7] 1. Find $\int \frac{x+11}{x^2+4x-5} dx$.

$$x^2+4x-5=0$$

$$x = \frac{-4 \pm \sqrt{16+20}}{2} = \begin{matrix} 1 \\ -5 \end{matrix}$$

$$\begin{aligned} \frac{x+11}{x^2+4x-5} &= \frac{A}{x-1} + \frac{B}{x+5} = \frac{A(x+5)+B(x-1)}{(x-1)(x+5)} = \\ &= \frac{(A+B)x + 5A - B}{(x-1)(x+5)} \end{aligned}$$

$$\left. \begin{array}{l} A+B=1 \\ 5A-B=11 \end{array} \right\} \Rightarrow \begin{array}{l} B=1-A \\ 5A-(1-A)=11 \\ A=2, B=-1 \end{array}$$

$$\begin{aligned} \int \frac{x+11}{x^2+4x-5} dx &= \int \frac{2}{x-1} dx + \int \frac{-1}{x+5} dx = \\ &= 2 \ln|x-1| - \ln|x+5| + C \end{aligned}$$

2. For each of the following two improper integrals, determine whether it is convergent or divergent. If the integral is convergent, determine its value.

[4] (a) $\int_1^4 \frac{2}{(x-3)^2} dx$

$$\int_1^4 \frac{2}{(x-3)^2} dx = \int_1^3 \frac{2}{(x-3)^2} dx + \int_3^4 \frac{2}{(x-3)^2} dx =$$

$$= \lim_{c \rightarrow 3^-} \int_1^c \frac{2}{(x-3)^2} dx + \lim_{c \rightarrow 3^+} \int_c^4 \frac{2}{(x-3)^2} dx =$$

$$= \lim_{c \rightarrow 3^-} \left[-\frac{2}{x-3} \right]_1^c + \lim_{c \rightarrow 3^+} \left[-\frac{2}{x-3} \right]_c^4$$

$u = x-3$
 $du = dx$

$\infty \qquad \qquad \qquad \infty$

The integral is divergent.

[4] (b) $\int_5^\infty \frac{2}{(x-3)^2} dx$

$$\int_5^\infty \frac{2}{(x-3)^2} dx = \lim_{c \rightarrow \infty} \int_5^c \frac{2}{(x-3)^2} dx =$$

$$= \lim_{c \rightarrow \infty} \left[-\frac{2}{x-3} \right]_5^c = \lim_{c \rightarrow \infty} -\frac{2}{c-3} - \left(-\frac{2}{5-3} \right) =$$

$$= 0 + 1 = 1$$

[7] 3. Evaluate $\int x^2 \cos x \, dx$.

$$u = x^2, \quad v' = \cos x, \quad v = \sin x$$

$$\int x^2 \cos x \, dx = x^2 \sin x - \int 2x \sin x \, dx =$$

$$u = 2x, \quad v' = \sin x, \quad v = -\cos x$$

$$= x^2 \sin x - \left(2x(-\cos x) - \int 2(-\cos x) \, dx \right) =$$

$$= x^2 \sin x + 2x \cos x - \int 2 \cos x \, dx =$$

$$= x^2 \sin x + 2x \cos x - 2 \sin x + C$$

- [4] 4. Use the trapezoidal rule with $n = 4$ intervals to approximate the value of $\int_3^5 x^2 dx$. Compare the approximation with the exact value of the integral.

$$\Delta x = \frac{5-3}{4} = 0.5$$

$$x_0 = 3, \quad x_1 = 3.5, \quad x_2 = 4, \quad x_3 = 4.5, \quad x_4 = 5$$

$$\begin{aligned} \int_3^5 x^2 dx &\approx \frac{5-3}{4} \left(\frac{3^2}{2} + 3.5^2 + 4^2 + 4.5^2 + \frac{5^2}{2} \right) = \\ &= 32.75 \end{aligned}$$

$$\begin{aligned} \int_3^5 x^2 dx &= \left[\frac{x^3}{3} \right]_3^5 = \frac{125}{3} - \frac{27}{3} = \\ &= \frac{98}{3} \approx 32.67 \end{aligned}$$

[7] 5. Solve the differential equation

$$\frac{dy}{dx} = 2\sqrt{y}$$

with the initial condition $y(0) = 4$.

$$\frac{dy}{dx} = 2\sqrt{y}$$

$$\frac{dy}{2\sqrt{y}} = dx$$

$$\int \frac{dy}{2\sqrt{y}} = \int dx$$

$$\sqrt{y} = x + C$$

$$y(0) = 4 \Rightarrow \sqrt{4} = 0 + C \Rightarrow C = 2$$

$$\sqrt{y} = x + 2$$

$$y(x) = (x + 2)^2$$

6. Let r and K be positive constants. The differential equation

$$\frac{dN}{dt} = rN \left(1 - \frac{N}{K}\right)$$

describes a well known growth model.

- [3] (a) Give the name of the model and describe the meaning of the symbols in the differential equation.

Logistic Equation (or Logistic Growth Model)

N ... population size

t ... time

r ... intrinsic rate of growth

K ... carrying capacity

- [4] (b) Let $r = 0.1$ and $K = 100$. Find the equilibria of the differential equation and the eigenvalues associated with them. Use the eigenvalues to determine the stability of the equilibria.

$$g(N) = 0.1 N \left(1 - \frac{N}{100}\right)$$

$$\text{equilibria: } g(\hat{N}) = 0 \Rightarrow \hat{N} = 0 \text{ or } \hat{N} = 100$$

$$g'(N) = 0.1 \left(1 - \frac{N}{100}\right) + 0.1 N \left(-\frac{1}{100}\right)$$

$$g'(0) = 0.1 \Rightarrow \hat{N} = 0 \text{ is an unstable equilibrium}$$

$$g'(100) = 0.1 \cdot 100 \cdot \left(-\frac{1}{100}\right) = -0.1$$

$$\Rightarrow \hat{N} = 100 \text{ is a locally stable equilibrium}$$
