

LAST NAME: _____

FIRST NAME: _____

Student Number: _____

CHM 1311 A

Midterm #1

Fall 2012

Please keep your work covered at all times and keep your eyes on your own paper! Cheating or any appearance of cheating will result in an F in the course and possible expulsion from the university.

There are 10 pages in this test. A periodic table and data sheets are provided at the end. You may rip these pages off of the exam and use them to cover your work during the test. Any scratch work should be done on the back of these pages.

Please show all work to receive partial credit.

You have 75 minutes to complete the test.

| Question | Points Possible | Points Earned | TA Initial |
|-----------------|------------------------|----------------------|-------------------|
| 1 | 10 | | |
| 2 | 10 | | |
| 3 | 10 | | |
| 4 | 10 | | |
| 5 | 10 | | |
| TOTAL | 50 | | |

#1. (10 points) Short Answer Questions

a) Name the following compounds:

b) The number of ions present in 250 mL of 0.00100 M CaCl₂ (aq) is:

4.52 x 10²⁰

2.50 x 10⁻⁴

6.02 x 10²³

1.51 x 10²⁰

c) Determine the oxidation state of the indicated element in the following:

oxidation state: _____

oxidation state: _____

d) Complete the following table:

| Chemical Symbol | Mass Number | Number of protons | Number of electrons | Number of neutrons |
|--|-------------|-------------------|---------------------|--------------------|
| ¹³³ ₅₅ Cs ⁺ | | | | |

e) The standard heat of formation of solid silver nitrate is -124.4 kJ. Write the chemical equation for the reaction to which this value applies (include phases).

f) If the molar mass of a gas is doubled, the root-mean-squared speed of the molecules will increase by a factor of $\sqrt{2}$. TRUE FALSE

g) A standard laboratory solution contains 1.8% sodium bromide. This concentration expressed in mol/L is: _____

h) Which of the following gaseous processes would produce the *largest positive* change in internal energy for the system?

EXOTHERMIC CONTRACTION

ENDOTHERMIC CONTRACTION

EXOTHERMIC EXPANSION

ENDOTHERMIC EXPANSION

#2. (10 points) A sulfide of iron, containing 36.5% S by mass, is heated in $O_2(g)$, and the products are sulfur dioxide and an oxide of iron containing 30.0% O by mass.

a) What is the empirical formula of the sulfide of iron?

Answer: _____

b) What is the empirical formula of the oxide of iron?

Answer: _____

c) Using these formulas, write a possible balanced chemical equation for the reaction described above.

d) Label the oxidation states of each element in your equation above and indicate which species is the oxidizing agent.

#3. (10 points). In the Marion lab, you mix 56.0 g of CaO with exactly 100 mL of water at 25.0°C and you observe the following reaction, as well as the release of some steam:

a) What is the reagent in excess and how many grams of it will be left at the end of the reaction?

Reagent in excess: _____

Mass: _____

b) Using the data in the table below and on page 9, calculate the mass of the steam that escaped during the reaction.

| | |
|---------------------------|---|
| CaO | $\Delta H_f^\circ = - 635 \text{ kJ/mol}$ |
| H₂O | $\Delta H_f^\circ = - 286 \text{ kJ/mol}$ |
| Ca(OH)₂ | $\Delta H_f^\circ = - 987 \text{ kJ/mol}$ |

Answer: _____

#4. (10 points) When Dr. Fox goes scuba diving, she uses NITROX, a special blend of enriched air that allows for more repetitive dives by reducing the build-up of nitrogen in the blood (that way, she won't get "the bends"!). The local scuba shop prepares 5.00 L tanks of NITROX by mixing 26.0 g of O₂ with 44.2 g of N₂ at a temperature of 25.0°C.

a) What is the mole fraction of each gas in the mixture?

$$\chi \text{ of N}_2 = \underline{\hspace{2cm}}$$

$$\chi \text{ of O}_2 = \underline{\hspace{2cm}}$$

b) What is the partial pressure of each gas, in atm?

$$P \text{ of N}_2 = \underline{\hspace{2cm}}$$

$$P \text{ of O}_2 = \underline{\hspace{2cm}}$$

c) What will be the total pressure left in the tank after Dr. Fox breathes 80% of it by volume during a dive?

$$P_T = \underline{\hspace{2cm}}$$

#5. (10 points) Steel is an alloy of iron and carbon, with iron being the major component. A steel ball has a radius of 5.85 mm and a density of 7.75 g/cm^3 . If the ball contains 0.25% carbon by mass, how many ^{13}C atoms are present in the ball? The percent natural abundance of carbon-13 is 1.108%. *Recall: volume of a sphere = $(4\pi r^3)/3$*

Answer: _____

Gas Laws

$$PV = nRT$$

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

$$P_T = P_1 + P_2 + P_3 + \dots$$

$$d = \frac{m}{V} = \frac{P \cdot MM}{RT}$$

$$E_K = \frac{1}{2}mv^2$$

$$u_{rms} = \sqrt{\frac{3RT}{MM}}$$

$$\frac{\text{Rate A}}{\text{Rate B}} = \sqrt{\frac{MM_B}{MM_A}}$$

$$\left(P + \frac{n^2 a}{V^2} \right) (V - nb) = nRT$$

Equilibrium

$$K_p = K_c(RT)^{\Delta n}$$

Acid/Base

$$pOH = -\log[OH^-]$$

$$pH = -\log[H^+]$$

$$pH + pOH = 14$$

$$K_a \times K_b = K_w$$

$$pH = pK_a + \log [A^-]/[HA]$$

$$pH = \frac{pK_{a1} + pK_{a2}}{2}$$

Thermochemistry

$$\Delta U = q + W$$

$$W_{\text{system}} = -P\Delta V = -\Delta nRT$$

$$\Delta H = \Delta U + P\Delta V$$

$$q_p = \Delta U + P\Delta V$$

$$q = ms\Delta T$$

$$\Delta H_{\text{rxn}}^\circ = \sum n\Delta H_f^\circ(\text{pds}) - \sum n\Delta H_f^\circ(\text{rxts})$$

The atom

$$E = h\nu$$

$$c = \nu\lambda$$

$$E = -B/n^2$$

Kinetics

$$[A]_t = [A]_o - kt$$

$$\ln[A]_t = \ln[A]_o - kt$$

$$1/[A]_t = 1/[A]_o + kt$$

$$k = Ae^{(-E_a/RT)}$$

$$\ln(k_2/k_1) = (-E_a/R)(1/T_2 - 1/T_1)$$

Data For Water

Density = 1.00 g/mL (at 25°C)

 $s = 2.13 \text{ J g}^{-1} \text{ K}^{-1}$ (solid) $s = 4.184 \text{ J g}^{-1} \text{ K}^{-1}$ (liquid) $s = 2.01 \text{ J g}^{-1} \text{ K}^{-1}$ (gas) $\Delta H^\circ_{\text{fus}} = 6.02 \text{ kJ mol}^{-1}$ $\Delta H^\circ_{\text{vap}} = 40.7 \text{ kJ mol}^{-1}$ **Constants and Conversion Factors**

$1 \text{ mmHg} = 1 \text{ torr}$ $760 \text{ mmHg} = 1 \text{ atm}$ $1 \text{ atm} = 101.325 \text{ kPa}$ $1 \text{ atm} = 1.013125 \text{ bar}$
 $1 \text{ cm}^3 = 1 \text{ mL}$ $1000 \text{ mL} = 1 \text{ L}$ $1000 \text{ L} = 1 \text{ m}^3$

| | | | |
|----------------------|-----|--|--|
| Avogadro's Number | N | $6.022 \times 10^{23} \text{ mol}^{-1}$ | |
| Boltzmann's constant | k | $1.30866 \times 10^{-23} \text{ J} \cdot \text{K}^{-1}$ | |
| Faraday's constant | F | $96,485 \text{ C} \cdot \text{mol}^{-1}$ | |
| Gas constant | R | $8.31451 \text{ J} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$ | |
| | R | $0.08206 \text{ atm} \cdot \text{L} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$ | |

#1. (10 points) Short Answer Questions

a) Name the following compounds:

NaClO₂ sodium chloriteMgSO₄• 5 H₂O magnesium sulfate pentahydrateb) The number of ions present in 250 mL of 0.00100 M CaCl₂ (aq) is:**4.52 x 10²⁰** 2.50 x 10⁻⁴ 6.02 x 10²³ 1.51 x 10²⁰**Note that the question asks for # of IONS, and each CaCl₂ unit produces 3 ions when dissolved!**

c) Determine the oxidation state of the indicated element in the following:

N in N₂O₅ oxidation state: +5O in Na₂O₂ oxidation state: -1

d) Complete the following table:

| Chemical Symbol | Mass Number | Number of protons | Number of electrons | Number of neutrons |
|--|-------------|-------------------|---------------------|--------------------|
| ¹³³ ₅₅ CS ⁺ | 133 | 55 | 54 | 78 |

e) The standard heat of formation of solid silver nitrate is -124.4 kJ. Write the chemical equation for the reaction to which this value applies (include phases).

f) If the molar mass of a gas is doubled, the root-mean-squared speed of the molecules will increase by a factor of $\sqrt{2}$. TRUE FALSEg) A standard laboratory solution contains 1.8% sodium bromide. This concentration expressed in mol/L is: 0.17 mol/Lh) Which of the following gaseous processes would produce the *largest positive* change in internal energy for the system? $\Delta U = q + W \rightarrow$ so, need +q and +W

EXOTHERMIC CONTRACTION

ENDOTHERMIC CONTRACTION

EXOTHERMIC EXPANSION

ENDOTHERMIC EXPANSION

#2. (10 points) A sulfide of iron, containing 36.5% S by mass, is heated in $O_2(g)$, and the products are sulfur dioxide and an oxide of iron containing 30.0% O by mass.

NOTE: THIS IS ADAPTED FROM CH 4 SUGGESTED PROBLEM #98

a) What is the empirical formula of the sulfide of iron?

Let us assume 100 g of Fe_xS_y :

$$? \text{ mol S} = 36.5 \text{ g S} \times \frac{\text{mol S}}{32.066 \text{ g S}} = 1.14 \text{ mol S}$$

$$? \text{ mol Fe} = (100.0 - 36.5) \text{ g Fe} \times \frac{\text{mol Fe}}{55.85 \text{ g Fe}} = 1.14 \text{ mol Fe}$$

$$\therefore Fe_{\frac{1.14}{1.14}} S_{\frac{1.14}{1.14}} \Rightarrow FeS$$

Answer: FeS

b) What is the empirical formula of the oxide of iron?

Let us assume 100 g of Fe_xO_y :

$$? \text{ mol O} = 30.0 \text{ g O} \times \frac{\text{mol O}}{15.999 \text{ g O}} = 1.88 \text{ mol O}$$

$$? \text{ mol Fe} = (100.0 - 30.0) \text{ g Fe} \times \frac{\text{mol Fe}}{55.85 \text{ g Fe}} = 1.25 \text{ mol Fe}$$

$$\therefore Fe_{\frac{1.25}{1.25}} O_{\frac{1.88}{1.25}} \Rightarrow Fe_{1.0} O_{1.5} \Rightarrow Fe_2O_3$$

Answer: Fe₂O₃

c) Using these formulas, write a possible balanced chemical equation for the reaction described above.

oxidizing agent = O_2

d) Label the oxidation states of each element in your equation above and indicate which species is the oxidizing agent.

#3. (10 points). In the Marion lab, you mix 56.0 g of CaO with exactly 100 mL of water at 25.0°C and you observe the following reaction, as well as the release of some steam:

a) What is the reagent in excess and how many grams of it will be left at the end of the reaction?

NOTE: THIS IS A LIMITING REAGENT PROBLEM ALMOST IDENTICAL TO A PROBLEM I SOLVED IN DGD#5 AND ALSO VERY SIMILAR TO CH 4 SUGGESTED PROBLEM #69

$$? \text{ mol Ca(OH)}_2 \text{ from CaO} = 56.0 \text{ g CaO} \times \frac{1 \text{ mol CaO}}{56.077 \text{ g CaO}} \times \frac{1 \text{ mol Ca(OH)}_2}{1 \text{ mol CaO}} = 0.999 \text{ mol}$$

$$? \text{ mol Ca(OH)}_2 \text{ from H}_2\text{O} = 100 \text{ mL H}_2\text{O} \times \frac{1 \text{ g H}_2\text{O}}{1 \text{ mL H}_2\text{O}} \times \frac{1 \text{ mol H}_2\text{O}}{18.02 \text{ g H}_2\text{O}} \times \frac{1 \text{ mol Ca(OH)}_2}{1 \text{ mol H}_2\text{O}} = 5.55 \text{ mol}$$

∴ H₂O is the reagent in excess!

$$? \text{ g H}_2\text{O reacted} = 0.999 \text{ mol Ca(OH)}_2 \times \frac{1 \text{ mol H}_2\text{O}}{1 \text{ mol Ca(OH)}_2} \times \frac{18.02 \text{ g H}_2\text{O}}{\text{mol H}_2\text{O}} = 18.0 \text{ g}$$

$$\therefore ? \text{ g H}_2\text{O leftover} = 100.0 \text{ g} - 18.0 \text{ g} = 82.0 \text{ g}$$

Reagent in excess: H₂O Mass: 82.0 g

b) Using the data in the table below and on page 9, calculate the mass of the steam that escaped during the reaction.

| | |
|---------------------|--|
| CaO | $\Delta H_f^\circ = -635 \text{ kJ/mol}$ |
| H ₂ O | $\Delta H_f^\circ = -286 \text{ kJ/mol}$ |
| Ca(OH) ₂ | $\Delta H_f^\circ = -987 \text{ kJ/mol}$ |

NOTE: THIS IS A SIMPLIFIED VERSION OF PRACTICE PROBLEM B ON PAGE 283 OF PETRUCCI 10th ED.

$$\begin{aligned} \Delta H_{\text{rxn}}^\circ &= [\Delta H_f^\circ \text{ Ca(OH)}_2] - [\Delta H_f^\circ \text{ CaO} + \Delta H_f^\circ \text{ H}_2\text{O}] \\ &= [-987] - [(-635) + (-286)] \text{ kJ/mol} = -66 \text{ kJ/mol} \end{aligned}$$

$$q_{\text{rxn}} = \frac{-66 \text{ kJ}}{\text{mol Ca(OH)}_2} \times 0.999 \text{ mol Ca(OH)}_2 \approx -66 \text{ kJ}$$

So, the reaction releases about 66 kJ of heat. This heat is therefore absorbed by the excess water, or:

$$\therefore q_{\text{H}_2\text{O}} = +66 \text{ kJ}$$

The 66 kJ absorbed by the 82.0 g of water must be used to do two processes: 1) to raise the temperature of the water from 25°C to 100°C and 2) to evaporate the water at 100°C to make the observed steam. Let's calculate how much heat it takes to do step 1:

$$\therefore q_{\text{H}_2\text{O}} = ms\Delta T = (82.0 \text{ g})(4.184 \text{ J/g}^\circ\text{C})(100^\circ\text{C} - 25^\circ\text{C}) = +25\,700 \text{ J} = +25.7 \text{ kJ}$$

Therefore, the "leftover" heat energy is 66 kJ - 25.7 kJ = 40.3 kJ. This is the amount of heat used to evaporate the water (step 2). We can thus calculate the mass of evaporated water (steam) using the enthalpy of vaporization ($\Delta H_{\text{vap}}^\circ$) from page 9:

$$? \text{ g H}_2\text{O} = 40.3 \text{ kJ} \times \frac{\text{mol H}_2\text{O}}{40.7 \text{ kJ}} \times \frac{18.02 \text{ g H}_2\text{O}}{\text{mol H}_2\text{O}} = 17.8 \text{ g}$$

Answer: 17.8 g

#4. (10 points) When Dr. Fox goes scuba diving, she uses NITROX, a special blend of enriched air that allows for more repetitive dives by reducing the build-up of nitrogen in the blood (that way, she won't get "the bends"!). The local scuba shop prepares 5.00 L tanks of NITROX by mixing 26.0 g of O₂ with 44.2 g of N₂ at a temperature of 25.0°C.

NOTE: THIS QUESTION WAS INSPIRED BY ASSIGNMENT #3 ITEM 2

a) What is the mole fraction of each gas in the mixture?

$$? \text{ mol O}_2 = 26.0 \text{ g O}_2 \times \frac{\text{mol O}_2}{31.998 \text{ g O}_2} = 0.812 \text{ mol O}_2$$

$$? \text{ mol N}_2 = 44.2 \text{ g N}_2 \times \frac{\text{mol N}_2}{28.014 \text{ g N}_2} = 1.578 \text{ mol N}_2$$

$$\text{Total mol } n_T = 0.812 + 1.578 = 2.39 \text{ mol}$$

$$\therefore \chi_{\text{N}_2} = \frac{1.578 \text{ mol}}{2.39 \text{ mol}} = 0.660$$

$$\therefore \chi_{\text{O}_2} = \frac{0.812 \text{ mol}}{2.39 \text{ mol}} = 0.340$$

$$\chi \text{ of N}_2 = \underline{\quad 0.660 \quad} \qquad \chi \text{ of O}_2 = \underline{\quad 0.340 \quad}$$

b) What is the partial pressure of each gas, in atm?

$$P_T = \frac{n_T RT}{V} = \frac{(2.39 \text{ mol})(0.08206 \text{ L} \cdot \text{atm/mol} \cdot \text{K})(298\text{K})}{5.00 \text{ L}}$$

$$= 11.7 \text{ atm}$$

$$P_{\text{N}_2} = \chi_{\text{N}_2} \times P_T = (0.660)(11.7 \text{ atm})$$

$$= 7.7 \text{ atm}$$

$$P_{\text{O}_2} = \chi_{\text{O}_2} \times P_T = (0.340)(11.7 \text{ atm})$$

$$= 4.0 \text{ atm}$$

$$P \text{ of N}_2 = \underline{\quad 7.7 \text{ atm} \quad} \qquad P \text{ of O}_2 = \underline{\quad 4.0 \text{ atm} \quad}$$

c) What will be the total pressure left in the tank after Dr. Fox breathes 80% of it by volume during a dive?

If 80% has been consumed, there is 20% left.

V₂ is 20% of V₁ → Therefore, P₂ is 20% of P₁

$$P_2 = (0.20)(11.7 \text{ atm}) = 2.3 \text{ atm}$$

$$P_T = \underline{\quad 2.3 \text{ atm} \quad}$$

#5. (10 points) Steel is an alloy of iron and carbon, with iron being the major component. A steel ball has a radius of 5.85 mm and a density of 7.75 g/cm³. If the ball contains 0.25% carbon by mass, how many ¹³C atoms are present in the ball? The percent natural abundance of carbon-13 is 1.108%. Recall: *volume of a sphere* = $(4\pi r^3)/3$

NOTE: THIS IS VERY SIMILAR TO THE EXAMPLE PROBLEM AT THE END OF THE CHAPTER 2 NOTES, AND ALSO SIMILAR TO A PROBLEM I SOLVED IN THE DGD

This can be done in a single step using dimensional analysis. However, for clarity, I will show this solution stepwise:

$$? \text{ radius of ball, in cm} = 5.85 \text{ mm} \times \frac{1 \text{ cm}}{10 \text{ mm}} = 0.585 \text{ cm}$$

$$? \text{ volume of ball, in cm}^3 = \frac{4}{3} \times \pi \times (0.585 \text{ cm})^3 = 0.839 \text{ cm}^3$$

$$? \text{ mass of ball, in g} = 0.839 \text{ cm}^3 \times \frac{7.75 \text{ g steel}}{\text{cm}^3} = 6.50 \text{ g steel}$$

$$? \text{ mass of C, in g} = 6.50 \text{ g steel} \times \frac{0.25 \text{ g C}}{100 \text{ g steel}} = 0.0162 \text{ g C}$$

$$? \text{ mol of C} = 0.0162 \text{ g C} \times \frac{\text{mol C}}{12.011 \text{ g C}} = 0.00135 \text{ mol C}$$

$$? \text{ mol } ^{13}\text{C} = 0.00135 \text{ mol C} \times \frac{1.108 \text{ mol } ^{13}\text{C}}{100 \text{ mol C}} = 1.50 \times 10^{-5} \text{ mol } ^{13}\text{C}$$

$$? \text{ atoms } ^{13}\text{C} = 1.50 \times 10^{-5} \text{ mol } ^{13}\text{C} \times \frac{6.022 \times 10^{23} \text{ atoms } ^{13}\text{C}}{\text{mol } ^{13}\text{C}} = 9.03 \times 10^{18} \text{ atoms}$$

Answer: _____ **9.03 x 10¹⁸ atoms** _____
