

ADM 2304
APPLIED STATISTICAL METHODS IN BUSINESS

5 October 2013

9:00 – 11:00 AM

NAME (please print): _____

Student Number: _____ Section: _____

Instructions

Length of Exam: 5 pages, plus 2 pages of Minitab output (please return).

Please show all your work and explain your answers briefly when asked. All tests must include hypotheses, test statistics and rejection regions, decisions, and conclusions for full marks.

You are encouraged to use the Minitab output as much as possible.

You are permitted to have a non-programmable calculator and a sheet (8.5 x 11 inch) of notes.

Statistical tables (normal and t) are provided separately (please keep).

Marks: _____ + _____ + _____ + _____ = _____
 10 11 11 4 36

Statement of Academic Integrity

The School of Management does not condone academic fraud, an act by a student that may result in a false academic evaluation of that student or of another student. Without limiting the generality of this definition, academic fraud occurs when a student commits any of the following offences: plagiarism or cheating of any kind, use of books, notes, mathematical tables, dictionaries or other study aid unless an explicit written note to the contrary appears on the exam, to have in his/her possession cameras, radios (radios with head sets), tape recorders, pagers, cell phones, or any other communication device which has not been previously authorized in writing.

I have read the text on academic integrity and I pledge not to have committed or attempted to commit academic fraud in this examination.

Signed: _____

Question 1. [10 marks]

You have been asked to audit the books for a company. The tolerable rate of material errors in the company's accounts is 5%. Based on your experience for this company, you expect the rate to be less than 5% and take a random sample of 400 accounts to verify your expectations.

Based on your audit, you find that 10 of the 400 accounts contain material errors.

- (a) Using the 5% level of significance, test your claim that the true rate of material errors is less than 5%. Use the critical value approach.

[4]

- (b) Now calculate the p-value for your result. Explain your decision in light of this p-value.

[2]

- (c) Calculate an appropriate confidence interval to estimate the rate of material errors. Explain your decision in light of this confidence interval.

[2]

- (d) Suppose you want to estimate the rate of material errors using a 95% confidence interval with a margin of error of plus-or-minus 1%. What sample size would be required?

[2]

Question 2. [11 marks]

Your financial adviser is recommending funds in the real estate sector. He thinks that an investor can expect an average annual return 5.5% on real estate funds. Appendix A shows the annual returns for a sample of real estate funds.

- (a) Test the hypothesis that the average annual return is not 5.5%. Use the 1% level of significance and the critical value approach.

[4]

- (b) Are the assumptions of the test in (a) warranted? Explain.

[1]

- (c) What is the p-value for the above test? Explain what conclusion you can reach with this p-value.

[2]

- (d) Calculate the 99% symmetrical or 2-sided confidence interval for the average annual return. Is this confidence interval consistent with the conclusion you reached in part (a)? Explain.

[2]

- (e) If the standard deviation for the returns obtained on the real estate funds is 3.5%, calculate the sample size required for a 95% confidence interval and a margin of error of plus-or-minus 0.5 %.

[2]

Question 3. [11 marks]

A regional health authority wanted to analyze the data about the use of Primary Healthcare Facilities. Here "PCFVisits_AGE1" and "PCFVisits_AGE5" refers to two variables which indicate the number of visits made to primary healthcare facilities (which include visits to family physicians) by Age Group 1 (18 to 31 years) and Age Group 5 (more than 60 years). Use the output in Appendix B. Use a Level of Significance (LS) of 5% for the tests in part 'a' and 'b' below and use the critical value approach.

- (a) Test the hypothesis that there is a difference between the mean numbers of visits made by the two age groups.

[4]

- (b) Test the hypothesis that the difference between the mean numbers of visits made by the two age groups is not 1 visit.

[3]

- (c) What is the symmetrical 95% confidence interval for the difference between the mean numbers of visits for the two groups? Based on this confidence interval, can you justify the conclusions reached in parts 'a' and 'b' above? Explain.

[2]

- (d) Are the assumptions underlying the calculations above justified? Explain.

[2]

Question 4. [4 marks]

Suppose that 40% of baby-boomers feel unprepared for retirement.

- (a) Calculate the probability that a random sample of 500 baby-boomers would yield 175 or fewer who feel unprepared.

[2]

- (b) Calculate the probability that a random sample of 15 baby-boomers would yield only one or fewer who feel unprepared.

[2]

Appendix A

0.56	6.84	7.06	0.22	3.92	1.25	4.43	2.19	3.45
5.48	2.01	6.73	-1.07	8.15	0.00	-1.09	2.08	4.92
0.16	12.39	2.63						

You ask the financial advisor for more information and he produces the following numbers.

Variable	N	N*	Mean	SE Mean	StDev	Minimum	Q1	Median	Q3
% Return	21	0	3.443	0.753	3.452	-1.090	0.390	2.630	6.105

Variable	Maximum
% Return	12.390

Appendix B

Descriptive Statistics: PCFVisits_AG1, PCFVisits_AG5

Variable	N	N*	Mean	SE Mean	StDev	Minimum	Q1	Median	Q3
PCFVisits_AG1	47	0	1.681	0.274	1.878	0.000	0.000	1.000	3.000
PCFVisits_AG5	22	0	4.136	0.685	3.212	1.000	1.000	4.000	6.000

Variable	Maximum
PCFVisits_AG1	7.000
PCFVisits_AG5	12.000

Two-Sample T-Test and CI: PCFVisits_AG5, PCFVisits_AG1

Two-sample T for PCFVisits_AG5 vs PCFVisits_AG1

	N	Mean	StDev	SE Mean
PCFVisits_AG5	22	4.14	3.21	0.68
PCFVisits_AG1	47	1.68	1.88	0.27

Difference = μ (PCFVisits_AG5) - μ (PCFVisits_AG1)

Estimate for difference:

95% CI for difference:

T-Test of difference = _____ ; T-Value = _____ P-Value = _____ DF = 27
