

Department of Building, Civil and Environmental Engineering

ENGR 202: SUSTAINABLE DEVELOPMENT AND ENVIRONMENTAL STEWARDSHIP (SUMMER 2015, AA)

Assignment No. 2 (Given June 10, 2015; Due on June 17, 2015) (Total 8 marks)

Special Instructions: Provide a cover page clearly showing your name and student ID. 10% of the total grade will be deducted for the late submission per day. Submit your assignment before class starts on the due date.

Problem 1 (4 marks). Human subjects are involved in a medical study to represent certain segments of the population in terms of blood lead concentration, PbB. First, assume the normal distribution properly represents the population of children with the mean concentration of 22.5 $\mu\text{g}/\text{dl}$ and the standard deviation σ of 5.8 $\mu\text{g}/\text{dl}$. Then, determine the range of PbB values (minimum and maximum) that should be used for the top 3 % of PbB values in the population. Use the cumulative density function table provided.

Problem 2 (4 marks). If NiCad battery has a capacity of 0.9Ah, determine the remaining capacity after it sits at a room temperature for three months.
