

**Part A: Short Answer (1 Mark Each)**

**Question 1:** Consider the transformation formula:  $y = a[f(b(x - c))] + d$ . What does the b-value do to the graph? divides the x values by b

**Question 2:** Simplifying  $e^{2\ln(3)} + \log_4 12 - \log_4 3 + 3\log_2 1$  produces:

- a) 3                      b) 7                      **c) 10**                      d) 11                      e) 13

**Question 3:** Given  $f(x) = x^2 + 1$  and  $g(x) = 2x - 3$ , the simplified equation for  $f \circ g(x + 1)$

- a)  $4x^2 - 12x + 10$                       b)  $4x^2 - 8x + 5$                       c)  $2x^3 - 3x^2 + 2x - 2$                       **d)  $4x^2 - 4x + 2$**

**Question 4:** State the change of base formula to change  $\log_2 x$  into an expression that only has  $\log_5$

$$\log_2 x = \frac{\log_5 x}{\log_5 2}$$

**Question 5:** Write the following function as a piecewise function:  $g(x) = |x|$

$$g(x) = \begin{cases} x & x \geq 0 \\ -x & x < 0 \end{cases}$$

**Part B: Short Answer Choice (Show all work)**

**Question 1:** Using the grid below, answer the questions that are given:

	<p>a) Provide a graph for the following piecewise function: (3 Marks):</p> $f(x) = \begin{cases} 2x + 5 & x < -3 \\ (x + 1)^2 + 2 & -3 \leq x < 0 \\ \log_2 x & x > 0 \end{cases}$ <p>[1 Mark for each correct piece]                  [Remove ½ Mark for each missing hole]                  [Remove ½ mark if one or more arrows are missing]</p> <p>b) The Domain of this function is: (1 Mark)  <math>D = \{x \in R   x \neq 0\}</math></p> <p>c) The Range of this function is: (1 Mark)  <math>R = \{y \in R\}</math></p>
--	---

**Question 2:** Solve the following equation:  $-e^{-2x+1} + 10 = 8$ . (3 Marks)

$$-e^{-2x+1} = -2$$

$$e^{-2x+1} = 2 \quad [1 \text{ Mark}]$$

$$\ln(e^{-2x+1}) = \ln(2) \quad [1 \text{ Mark}]$$

$$-2x + 1 = \ln(2)$$

$$x = \frac{\ln(2)-1}{-2} \quad [1 \text{ Mark}]$$

**Question 3:** Determine the Domain of the following function:  $f(x) = \sqrt{-2x - 4} + \frac{1}{x^2 - 25}$  (3 Marks)

$$D = \{x \in R | x \leq -2 \text{ and } x \neq -5\}$$

or

$$D = (-\infty, -5) \cup (-5, -2]$$

[2 Marks for correct domain from the root function]  
 [1 Mark for correct domain from the rational function]  
 [Remove 0.5 marks if the domain is not simplified (ie if they wrote  $D = \{x \in R | x \leq -2 \text{ and } x \neq \pm 5\}$ )]

**Question 4:** Simplify:  $\text{ArcCos}\left(\text{Sin}\left(-\frac{5\pi}{6}\right)\right)$  (4 Marks)

$$= \text{Arccos}\left(\frac{-\sqrt{3}}{2}\right)$$

Thus we solve:  $\text{Cos}(\theta) = -1/2$

But for arccos, the range is

$$0 \leq \theta \leq \pi$$

$$\theta = \frac{2\pi}{3}$$

$$\text{Arcsin}\left(\text{Cos}\left(\frac{3\pi}{4}\right)\right) = \frac{2\pi}{3}$$

[1 Mark for first diagram (or justifying the Sin Ratio)]

[1 Mark to know we solve  $\text{Cos}(\theta)$  in the proper domain]

[1 Mark for second diagram (justifying solving Arccos in some manner)]

[1 Mark for final answer]

**Question 5:** Determine the inverse of the  $f(x)$ . State if the inverse is a function and how you know if it is a function. If the inverse is not a function, state a restriction on the domain of the **original function  $f(x)$**  so that the inverse will be a function (with the largest domain possible):  $f(x) = -4(x - 3)^2 + 2$  (5 Marks)

$$f(x) = -4(x - 3)^2 + 2$$

$$y = -4(x - 3)^2 + 2$$

$$x = -4(y - 3)^2 + 2 \quad [1 \text{ Mark}]$$

$$x - 2 = -4(y - 3)^2$$

$$\frac{x-2}{-4} = (y - 3)^2$$

$$\pm \sqrt{\frac{x-2}{-4}} = y - 3$$

$$3 \pm \sqrt{\frac{x-2}{-4}} = y \quad [1 \text{ Mark}]$$

This is not a function as we have  $\pm$  which allows for a choice of two outputs for almost every input (also the original fails the HLT). [1 Mark for it is not a function, 1 Mark for reasoning, only take of one mark if they forgot the  $\pm$ , but said it was a function]

To make the inverse a function, we would need to restrict the original function to a Domain of either  $D = \{x \in \mathbb{R} | x \geq 3\}$  or  $D = \{x \in \mathbb{R} | x \leq 3\}$  [1 Mark]

**Question 6:** Determine the exact value for  $\text{Sin}\left(\frac{\pi}{12}\right)$  (5 Marks)

(note there are other ways to split up the angle to answer the question all of which would be acceptable)

$$= \text{Sin}\left(\frac{\pi}{3} - \frac{\pi}{4}\right)$$

$$= \text{Cos}\left(\frac{\pi}{3}\right)\text{Sin}\left(\frac{-\pi}{4}\right) + \text{Sin}\left(\frac{\pi}{3}\right)\text{Cos}\left(\frac{-\pi}{4}\right)$$

$$= \left(\frac{1}{2}\right)\left(\frac{-1}{\sqrt{2}}\right) + \left(\frac{\sqrt{3}}{2}\right)\left(\frac{1}{\sqrt{2}}\right)$$

$$= \frac{-1+\sqrt{3}}{2\sqrt{2}}$$

[1 Mark knowing to split the angle]

[1 Mark to knowing that we can use an identity]

[1 Mark knowing the diagrams (or other justification that is reasonable)]

[1 Mark finding the correct special triangle ratios]

[1 Mark for simplifying to the final answer (no rationalization needed)]
