**VERSION A**  
**CH110/120 – Fundamentals of Chemistry/Introductory Chemistry**  
**Midterm #1**

Friday, October 2<sup>nd</sup>, 2015

5:35-6:50 pm

Instructor: Dr. Louise Dawe

Instructions:

**Multiple choice:**

1. On this paper test, mark your first (and second, and third) answers. Your IFAT card will not be returned, but this paper test will, and you might want a record of your answers for later study.
2. On your IFAT card, scratch your selection. A star will identify the correct answer
  - Star can be anywhere in the box, not just the middle!
  - Little scratches count as an attempt
  - Be careful to keep your place if you skip questions!
  - Scratch with care to avoid tearing the form
  - Plastic (ID cards) seems to be gentler than metal (coins)
3. Each multiple choice is worth 2 points. If you get a question wrong (no star where you scratch), go back and re-read the questions and try again
  - If it is right on the second try it is worth 1 point.
  - If it is right on the third try it is still worth 1/2 a point.
4. After you are finished, go back and make note of any questions that you would like discussed.
5. Only your IFAT card will count for marks, so it is your responsibility to ensure that you return it to the exam room proctors. Missing IFAT cards will get zero marks.
6. You only get one IFAT card. If you “mess it up”, there will be no replacement provided.
7. Keep your IFAT card turned face-down when you are not using it.

**Long Answer Problems:** Answer in the space provided.

Allowed aids: Non-programmable calculator. No additional aids permitted.

*Good luck!*

**I. Multiple Choice Questions** (10 questions, 2 marks each)

1. What are the stoichiometric coefficients needed in order to balance the equation?

A) 1, 1, 2, 3

B) 2, 3, 1, 1

C) 2, 3, 1, 3

D) 3, 6, 2, 3

**E) 3, 2, 1, 3**

Name:

2. How many moles of ethanol are present in 1.50 g of ethanol ( $\text{CH}_3\text{CH}_2\text{OH}$ )?  $46.0682 \text{ g} \cdot \text{mol}^{-1}$

- A) 0.0145 mol
- B) 30.7 mol
- C) 0.0326 mol
- D) 69.0 mol
- E)  $9.03 \times 10^{23}$  mol

$$\frac{1.50 \text{ g}}{46.0682 \text{ g} \cdot \text{mol}^{-1}} = 0.0326 \text{ mol}$$

3. What is the molar mass of butane if  $5.19 \times 10^{16}$  molecules of butane weigh  $5.00 \mu\text{g}$ ?

- A) 0.0172 g/mol
- B)  $5.80 \times 10^{13}$  g/mol
- C) 431 g/mol
- D) 172 g/mol
- E) 58.0 g/mol

$$\frac{5.00 \times 10^{-6} \text{ g}}{5.19 \times 10^{16} \text{ molecules}} \left( \frac{1 \text{ mol}}{6.022 \times 10^{23} \text{ molecules}} \right) = 58.0 \text{ g} \cdot \text{mol}^{-1}$$

4. Sodium sulfide is combined with iron(III) nitrate in aqueous solution. What will be the solid product of this reaction?

- A)  $\text{Fe}_2\text{S}_3$
- B)  $\text{NaNO}_3$
- C)  $\text{Na}_2\text{S}$
- D)  $\text{Fe}(\text{NO}_3)_3$
- E) No reaction takes place

5. A  $\text{Cu}(\text{ClO}_4)_2$  solution is  $0.205 \text{ mol L}^{-1}$ . How many mL of this solution are needed to make  $4.50 \times 10^2 \text{ mL}$  of a solution that is  $0.374 \text{ mol L}^{-1}$  in  $\text{ClO}_4^-$  ion?

- A)  $8.51 \times 10^{-5}$  mL
- B)  $1.70 \times 10^{-1}$  mL
- C)  $1.64 \times 10^3$  mL
- D)  $4.10 \times 10^2$  mL
- E)  $8.21 \times 10^2$  mL

$$C_i = 0.205 \text{ mol} \cdot \text{L}^{-1} (\text{Cu}(\text{ClO}_4)_2); C_f = 0.374 \text{ mol} \cdot \text{L}^{-1} (\text{ClO}_4^-) \left( \frac{1 \text{ mol } (\text{Cu}(\text{ClO}_4)_2)}{2 \text{ mol } (\text{ClO}_4^-)} \right)$$
$$V_i = \frac{C_f V_f}{C_i} = \frac{(0.187 \text{ mol} \cdot \text{L}^{-1})(450 \text{ mL})}{(0.205 \text{ mol} \cdot \text{L}^{-1})} = 4.10 \times 10^2 \text{ mL}$$
$$= 0.187 \text{ mol} \cdot \text{L}^{-1} (\text{Cu}(\text{ClO}_4)_2)$$

6. A student dissolved 0.0200 mol of  $\text{FeCl}_3$  in enough water to make  $2.50 \times 10^2 \text{ mL}$  of stock solution. She took 6.25 mL of the stock solution and then diluted it with water to give 1.00 L of a final solution. How many grams of  $\text{Cl}^-$  ion are in the final solution? (Molar masses:  $\text{FeCl}_3 = 162.207 \text{ g/mol}$ ; molar mass of  $\text{Cl}^- = 35.453 \text{ g/mol}$ )

- A)  $1.33 \times 10^{-2}$  g
- B)  $1.77 \times 10^{-2}$  g
- C)  $5.32 \times 10^{-2}$  g
- D)  $2.43 \times 10^{-1}$  g
- E) 2.13 g

$$\left( \frac{0.0200 \text{ mol } \text{FeCl}_3}{0.250 \text{ L}} \right) (0.00625 \text{ L}) \left( \frac{3 \text{ mol } \text{Cl}^-}{1 \text{ mol } \text{FeCl}_3} \right) \left( \frac{35.453 \text{ g}}{1 \text{ mol } \text{Cl}^-} \right)$$
$$= 0.0532 \text{ g}$$
$$= 5.32 \times 10^{-2} \text{ g}$$

Name:

Student #:

7. Which one of the following is **not** a property used to determine the physical behaviour of an **ideal** gas?

- A) Amount of gas
- B) Molar mass of the gas**
- C) Volume
- D) Temperature
- E) Pressure

8. What is the total pressure in a 10.0 L flask which contains 0.127 mol of  $H_2$  (g) and 0.288 mol of  $N_2$  (g) at 293.15 K?

- A) 0.0681 atm
- B) 0.306 atm
- C) 0.998 atm**
- D) 0.387 atm
- E) 0.693 atm

$$P_{\text{Total}} = \frac{n_{\text{Total}} R T}{V} = \frac{(0.415 \text{ mol}) (0.08206 \text{ L}\cdot\text{atm}\cdot\text{mol}^{-1}\cdot\text{K}^{-1}) (293.15 \text{ K})}{10.0 \text{ L}} = 0.998 \text{ atm}$$

9. A gas with an initial volume of 4.0 L at 300 K is compressed to a volume of 2.0 L while simultaneously being heated to 600 K. What happens to the gas pressure? (Note: The amount of gas does not change)

- A) Quadruples**
- B) Doubles
- C) Halves
- D) Quarters
- E) Remains unchanged

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$
$$P_2 = \frac{P_1 V_1 T_2}{T_1 V_2} = \frac{P_1 (4.0 \text{ L}) (600 \text{ K})}{(300 \text{ K}) (2.0 \text{ L})} = 4 P_1$$

10. Four identical flasks each contain the same amount of gas at 25.0 °C. Flask A contains  $CH_4$ , flask B contains  $N_2$ , flask C contains Ar and flask D contains  $CO_2$ . Which flask exhibits the greatest pressure?

- A) Flask A
- B) All four flasks exhibit the same pressure**
- C) Flask C
- D) Flask D
- E) Flask B

**II. Problems** (Show your work and give your answer in the space provided. Use the back of the page if you require extra space.)

1. Iron(III) oxide reacts with carbon monoxide according to the following *unbalanced* equation:

(1 point) (a) Write out the full balanced equation below. Include phases.

(4 points) (b) What volume of carbon dioxide will be produced when 22.55 g of  $\text{Fe}_2\text{O}_3$  are combined with 14.78 g of CO under standard temperature and pressure (STP; that is, temperature is 273.15 K and pressure is 1.00 bar.) Molar masses: CO = 28.0101 g/mol;  $\text{CO}_2$  = 44.0095 g/mol;  $\text{Fe}_2\text{O}_3$  = 159.6932 g/mol; Fe = 55.8475 g/mol

$$n_{\text{CO}_2} \text{ produced if } \text{Fe}_2\text{O}_3 \text{ limits} = 22.55 \text{ g } \text{Fe}_2\text{O}_3 \left( \frac{1 \text{ mol } \text{Fe}_2\text{O}_3}{159.6932 \text{ g } \text{Fe}_2\text{O}_3} \right) \left( \frac{3 \text{ mol } \text{CO}_2}{1 \text{ mol } \text{Fe}_2\text{O}_3} \right) = 0.42362 \text{ mol } \text{CO}_2$$

$$n_{\text{CO}_2} \text{ produced if CO limits} = 14.78 \text{ g CO} \left( \frac{1 \text{ mol CO}}{28.0101 \text{ g}} \right) \left( \frac{3 \text{ mol } \text{CO}_2}{3 \text{ mol CO}} \right) = 0.52766 \text{ mol } \text{CO}_2$$

$\text{Fe}_2\text{O}_3$  limits the yield of  $\text{CO}_2$  & is therefore the limiting reactant.

$$V_{\text{CO}_2} \text{ produced} = 0.42362 \text{ mol} \left( \frac{22.7 \text{ L}}{1 \text{ mol}} \right) = 9.62 \text{ L}$$

@ STP

$$\text{or } V = \frac{nRT}{P} = \frac{0.42362 \text{ mol} (0.08314 \text{ L} \cdot \text{bar} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}) (273.15 \text{ K})}{1.00 \text{ bar}} = 9.62 \text{ L}$$

(2 points) (c) How many grams of the excess reagent will be left over after the reaction is complete? Assume 100% yield.

$$\begin{aligned} & m_{\text{available}} - m_{\text{required}} \\ &= 14.78 \text{ g} - 0.42362 \text{ mol } \text{CO}_2 \left( \frac{3 \text{ mol CO}}{3 \text{ mol } \text{CO}_2} \right) \left( \frac{28.0101 \text{ g CO}}{1 \text{ mol CO}} \right) \\ &= 14.78 \text{ g} - 11.865 \text{ g} = \boxed{2.92 \text{ g of CO in XS}} \end{aligned}$$

Name:

Student #:

$$\rightarrow 18^\circ\text{C} + 273.15 =$$

2. A gas mixture contains 1.25 g  $\text{N}_2$  and 0.85 g  $\text{O}_2$  in 1.5 L container at  $18^\circ\text{C}$ . Calculate: 291.15K

$$28.0134\text{g}\cdot\text{mol}^{-1} \quad 31.9988\text{g}\cdot\text{mol}^{-1}$$

(2 marks) (a) the mole fraction of  $\text{N}_2$  and the mole fraction of  $\text{O}_2$ .

$$\left. \begin{aligned} n_{\text{N}_2} &= 1.25\text{g} \left( \frac{1\text{mol N}_2}{28.0134\text{g}} \right) = 0.04462\text{ mol N}_2 \\ n_{\text{O}_2} &= 0.85\text{g} \left( \frac{1\text{mol O}_2}{31.9988\text{g}} \right) = 0.0265\text{ mol O}_2 \end{aligned} \right\} n_{\text{Total}} = n_{\text{N}_2} + n_{\text{O}_2} = 0.0711\text{ mol}$$

$$X_{\text{N}_2} = \frac{n_{\text{N}_2}}{n_{\text{Total}}} = \frac{0.04462\text{ mol}}{0.0711\text{ mol}} = 0.627 = 0.63$$

$$X_{\text{O}_2} = 1 - X_{\text{N}_2} = 1 - 0.627 = 0.373 = 0.37$$

(2 marks) (b) the partial pressure of  $\text{N}_2$  and the partial pressure of  $\text{O}_2$ , expressed in bar.

$$P_{\text{Total}} = \frac{n_{\text{Total}} R T}{V} = \frac{(0.0711\text{ mol})(0.08314\text{ L}\cdot\text{bar}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})(291\text{ K})}{1.5\text{ L}}$$
$$= 1.14\text{ bar}$$

$$P_{\text{N}_2} = (P_{\text{Total}})(X_{\text{N}_2}) = (1.14\text{ bar})(0.627) = 0.71\text{ bar}$$

$$P_{\text{O}_2} = (P_{\text{Total}})(X_{\text{O}_2}) = (1.14\text{ bar})(0.373) = 0.43\text{ bar}$$
