

**SPORE-FORMING GRAM POSITIVE BACILLI (RODS)**

**BACILLUS- aerobic**

BACTERIA	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<p><b>Bacillus Anthracis</b></p>	<p>Anthrax</p>	<p>Not discussed</p> <p>Bad poison; easy to track, hard to assemble</p>	<p>Contact with ANIMALS (cows &amp; sheep) or SOIL</p> <p>Bioterrorism &amp; warfare</p>	<p>RAPID treatment is essential</p> <p>Antibiotics</p> <p>Vaccine against PA protein available</p>	<p>Only bacteria with antiphagocytic <b>PROTEIN capsule</b> (most are sugar)</p> <p><b>Aerobic</b> growth conditions</p> <p>V. <b>stable spores</b> (heat, drying, UV, disinfectant resistant)</p> <p>Toxins produced after spore germination (only under good growth conditions)</p> <p><b>Exotoxin:</b> 3 different proteins (nontoxic separately)</p> <ul style="list-style-type: none"> <li>● Edema Factor (EF)</li> <li>● Protective Antigen (PA)</li> <li>● Lethal Factor (LF)</li> </ul> <p><b>Plasmids:</b> BOTH required for virulence</p> <ul style="list-style-type: none"> <li>● pXO1: encodes exotoxins; virulence factors transcribed optimally @ 37°C, inc. CO<sup>2</sup> and serum proteins                             <ul style="list-style-type: none"> <li>○ ANIMAL HIDE</li> </ul> </li> <li>● pXO2: encodes plasmid genes</li> </ul>
<p><b>Bacillus Cereus</b></p>	<p>Food Poisoning</p>	<p><b>Heat Labile:</b> nausea, abdominal pain, diarrhea (12-24 hours)</p> <p><b>Heat Stable:</b> SEVERE nausea &amp; vomiting, short incubation</p>	<p>Undercooked food infected with spores</p>	<p>Preformed toxins mean antibiotics are USELESS!</p>	<p>Motile, non-encapsulated</p> <p>Resistant to penicillin</p> <p><b>2 enterotoxins:</b></p> <ul style="list-style-type: none"> <li>● Heat-labile toxin</li> <li>● Heat-stable toxin</li> </ul>

**SPORE-FORMING GRAM POSITIVE BACILLI (RODS)**

**CLOSTRIDIUM**- anaerobic; POWERFUL EXOTOXINS (require rapid diagnosis)

BACTERIA	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<b>Clostridium Botulinum</b>	Botulism (rapidly fatal food poisoning from lethal neurotoxin)	<p>Bilateral, symmetrical, top-down, flaccid paralysis!!!!</p> <p>Afebrile (no fever)</p> <p>Double vision, trouble swallowing</p> <p>RESP. PARALYSIS (usually fatal symptom)</p> <p><b>Infant botulism:</b> honey contaminated by spores; bacteria colonize intestine; 2-3 days of constipation; floppy baby syndrome, death</p>	<p>Smoked fish</p> <p>Improperly canned vegetables</p> <p>Fermented meat (common aboriginal prep method)</p> <p>Honey in children under 3 = infant botulism if spores present</p> <p>Proper cooking destroys spores</p>	<p>Antitoxin</p> <p>RESP. ASSISTANCE until respiratory muscles regain function</p>	<p><b>Exotoxin:</b> neurotoxin that blocks ACh release in autonomic nervous system</p> <p>Botox (type A) diluted</p> <ul style="list-style-type: none"> <li>Useful for excessive sweating, muscle disorders</li> </ul>
<b>Clostridium Tetani</b>	Tetanus	<p>Sustained skeletal muscle contraction</p> <p>Severe muscle spasms (lockjaw)</p> <p>Death by heart failure</p>	<p>Spores enter through a break in the skin</p> <p>Spores found in soil &amp; animal feces</p> <p>Rusty nail MUST HAVE SPORES</p> <p>Wound provides anaerobic environment</p>	<p><b>Booster</b> (inactivated toxoid) given every 10 years to maintain immune response</p> <ul style="list-style-type: none"> <li>Most other vaccines don't require this!!!</li> </ul>	<p><b>Exotoxin:</b> tetanospasmin</p>
<b>Clostridium Perfringens</b>	Gas Gangrene	<p><b>Wound infection / cellulitis:</b> necrotic skin exposed to bacteria; damage to local tissues; skin feels moist/spongy with "crackly" pockets</p>	<p>Soldiers wounded in battle; open wounds in damp conditions</p> <p>Wound provides anaerobic environment</p>	<p>Clostridial myonecrosis class treated with OXYGEN, ANTIBIOTICS (penicillin), and REMOVAL OF DAMAGED TISSUE</p>	<p>Spores release <b>gas</b> under skin; causes crackling skin symptom</p>

		<b>Clostridial myonecrosis:</b> bacteria inoculated from trauma into muscles; exotoxin secretion destroys adjacent muscles; <b>BLACK FLUID</b> secreted from skin; <b>FATAL</b> if untreated			
<b>Clostridium Difficile</b>	Antibiotic associated pseudomembranous colitis	<p>Infects the <b>colon</b>, where it releases exotoxins</p> <p><b>Toxin A:</b> diarrhea</p> <p><b>Toxin B:</b> cytotoxic to colon cells</p> <p>Severe diarrhea</p> <p>Abdominal cramping</p> <p>Fever</p>	<p>Arises from overuse of broad spectrum antibiotics, which destroy normal intestinal flora</p> <p>Enters orally</p> <p>Very common in hospitals- <b>NOSOCOMIAL</b></p>	<p>Considered immediately in patients who have diarrhea &amp; are on antibiotics</p> <p>Discontinue antibiotic treatment</p> <p>Vancomycin or metronidazole (given orally; not absorbed into bloodstream)</p> <p>Live probiotics to restore flora</p>	<p><b>2 Toxins:</b></p> <ul style="list-style-type: none"> <li>• Toxin A</li> <li>• Toxin B</li> </ul>

<b>NON SPORE-FORMING GRAM POSITIVE BACILLI (RODS)</b>					
<b>BACTERIA</b>	<b>DISEASE</b>	<b>SYMPTOMS</b>	<b>TRANSMISSION</b>	<b>DIAGNOSIS / TREATMENT</b>	<b>CHARACTERISTICS</b>
<b>Listeria Monocytogenes</b>	Listeriosis	<p><b>30% mortality</b></p> <p>General malaise</p> <p>Diarrhea</p> <p>Meningitis</p> <p>Septicemia</p> <p>Still birth / miscarriage</p> <p>Gastroenteritis (gastric inflammation)</p>	Soft cheeses, unpasteurized milk, cold cuts, pâté	Ampicillin or trimethoprim-sulfamethoxazole	<p>One of few bacteria that can <b>cross all 3 protective barriers</b></p> <ul style="list-style-type: none"> <li>• Blood-brain</li> <li>• Gastrointestinal</li> <li>• Feto-placental</li> </ul> <p>Immunocompromised are at high risk</p> <p><b>Psychrotroph/ophile;</b> grows at room temp</p> <p><b>Facultative intracellular aerobe</b></p>
<b>Corynebacterium Diphtheriae</b>	Diphtheria	Colonization of <b>pharynx</b> and release of exotoxins into <b>bloodstream</b>	Inhalation (colonizes pharynx)	<b>3 step treatment</b> 1. Antitoxin 2. Antibiotic	Can be <b>lysogenized</b> by a <b>bacteriophage</b> (helps it)

		<p>Damage to <b>heart &amp; neural cells</b></p> <p>Bull neck, respiratory symptoms, greyish membrane covering throat</p>		3. DPT vaccine	
--	--	---	--	----------------	--

## NON SPORE-FORMING GRAM NEGATIVE BACILLI (RODS)- THE ENTERICS >> diarrhea! :^)

Part of normal intestinal flora; can also cause disease

**4 major groups** (based on **biochemical & antigenic** properties)

- Enterobacteriaceae (Salmonella, Shigella, E. coli)
- Vibrionaceae (Vibrio, Campylobacter)
- Pseudomonadaceae (Pseudomonas)
- Bacteroidaceae

### Classification Types

#### Biochemical:

- **Ability to ferment lactose** (selective/differential media)
  - EMB media: lactose fermenters are dark purple/black; inhibits gram + bacteria
  - MacConkey media: lactose fermenters are pink/purple; inhibits gram + bacteria
- **H<sub>2</sub>S (hydrogen sulfide) production**
- **Hydrolysis of urea**
- **Liquify gelatin**
- **Decarboxylation of amino acids**

#### Surface antigens: H.O.K.

- **H-antigen**
  - Flagellar subunit; only in motile bacteria
- **Variable O-antigen**
  - Outermost layer of LPS; changes between enterics
- **K- antigen**
  - Capsule that covers the O-antigen

### Types of Enteric Diseases

- **Diarrhea with or without systemic invasion** (ex: vibrio cholera)
  - No cell invasion; bacteria bind intestinal cells but do not enter
  - EXOTOXIN causes diarrhea & ENTEROTOXIN causes fluid/electrolyte loss
    - **Watery diarrhea**
  - No fever!
- **Diarrhea with invasion of intestinal cells** (ex: shigella)
  - Invasion of cell allowed by virulence factors
  - Toxins destroy cells
    - **Bloody stool**
  - Systemic immune response
    - **Fever!**
- **Diarrhea with invasion of lymph nodes and bloodstream** (ex: salmonella enterica)
  - Abdominal pain
    - **Diarrhea containing WBCs & RBCs**
  - Fever, headache, increased WBC count
- **Various other infections**
  - UTIs, pneumonia, bacteremia, sepsis

# NON SPORE-FORMING GRAM NEGATIVE BACILLI (RODS)- THE ENTERICS

## ENTEROBACTERIACEAE

BACTERIA	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<b>SALMONELLAE</b>	Unable to ferment lactose; motile; all have animal reservoirs except <i>S. enterica</i> serovar Typhi; <b>2 species:</b> <i>S. enterica</i> & <i>S. bongori</i> (salmonellae enterica more important) <b>5 types of infections in humans:</b> <ul style="list-style-type: none"> <li>enterocolitis, enteric fever, opportunistic infections, septicemia, and osteomyelitis</li> </ul>				
<b>Salmonellae Enterica</b>  Serovar enteritidis  &  Serovar typhimurium	Enterocolitis (tummy problems)	6-48 hour multiplication in <b>small intestine</b>  Nausea, vomiting, <b>profuse</b> diarrhea, abdominal pain  Fever, chills, headache, myalgia (muscle pain)  Septicemia (rare)  Recovery in 2-3 days	Need fairly large dose for pathogenesis  Ingestion of contaminated food  Poultry, eggs, meat, and milk  Person-to-person spread possible (fecal-oral)  Most cases occur at home  Under-reported and underdiagnosed	<b>Stool culture</b> for lab diagnosis  Antibiotics <b>not</b> recommended ; grow better with some antibiotics	Severity of disease impacted by: <ul style="list-style-type: none"> <li>health of host</li> <li>dose of ingested organisms</li> <li>virulence of infecting strain</li> </ul>
<b>Salmonellae Enterica</b>  Serovar typhi  &  Serovar paratyphi	Enteric Fever	Serovar typhi = <b>typhoid fever</b>  Serovar paratyphi = <b>paratyphoid fever</b> (milder)  Generalized infection  Bacterial multiplication in lymphoid tissue  Necrosis of intestinal lymphoid tissue; ulceration, hemorrhage, perforation  10% mortality if	Contaminated drinking water, shellfish, milk & milk products  <b>Convalescent carriers:</b> excrete bacteria for 3 months through stool  <b>Chronic carriers (1-2%):</b> excrete bacteria for at least 6 months (sometimes forever)	<b>1<sup>st</sup> week:</b> isolation of bacteria from blood  <b>2<sup>nd</sup>-3<sup>rd</sup> week:</b> isolation from stool & urine  Vaccine available; only effective against small bacterial load	Relatively high infective dose  Clean handling of food, proper water treatment & sanitation are essential

		left untreated			
<b>ESCHERICHIA COLI</b>	Most numerous aerobic bacteria of normal gut flora; pathogenic to other parts of the body >>responsible for 85% of all bacteriuria Lactose fermenting Implicated in <b>neonatal meningitis</b> and <b>nosocomial urinary / wound infections</b>				
<b>Enterotoxigenic E. coli</b>	Gastro-enteritis	Infant diarrhea (developing countries)  Traveller's diarrhea	Unfamiliar strains in foreign country's water or food	Not discussed	<b>Enterotoxins</b>
<b>Enteroinvasive E. coli</b>	Gastro-enteritis	Symptoms similar to shigellosis	Not discussed	Not discussed	Not discussed
<b>Enteropathogenic E. coli</b>	Gastro-enteritis	Infant diarrhea	Not discussed	Not discussed	Older name for some serotypes causing infant diarrhea
<b>E. coli O157:H7</b> <b>Hamburger disease</b>	Gastro-enteritis	Hemorrhagic colitis (bloody diarrhea)	Undercooked hamburgers  Improperly washed/prepared food	Not discussed	Safe preparation and cooking of food are essential to prevent illness
<b>SHIGELLAE</b>	Generally non-lactose fermenting				
<b>Shigellae Sonnei</b>	Not discussed	Acute diarrhea with mucus, pus, and blood	Not discussed	Not discussed	Not discussed
<b>Shigellae Dysenteriae</b>	Dysentery	<b>Severe</b> illness; acute watery diarrhea with mucus, pus, and blood	Infection from <b>small</b> number of organisms  Poor sanitation and crowding	No vaccine	Commonly seen in <b>children</b>  Prevention by safe food handling, water treatment, sewage disposal
<b>Vibrio Cholerae</b>	Cholera (acute gastro-intestinal illness)	<b>Profuse</b> watery diarrhea, cramps, vomiting (rice water)  <b>Severe</b> dehydration and death if untreated	Water-borne  Endemic in Southeast Asia and parts of Africa  Unclean drinking water	Not discussed	Cells secrete <b>chlorides</b> which <b>decrease Na<sup>+</sup> absorption</b> ; water accumulates in gut and leads to watery diarrhea
<b>Campylobacter jejuni</b> &	Human enteritis	Fever, abdominal pain, <b>bloody diarrhea</b>  Traveller's	Normal flora in <b>birds &amp; domestic animals</b>	Not discussed	Some strains <b>invasive</b> , others <b>toxigenic</b>

<b>Campylobacter coli</b>		diarrhea			
<b>PSEUDOMONAS</b>	Opportunistic pathogen; all strains are resistant to many antibiotics				
<b>Pseudomonas aeruginosa</b>	Resp. pathogen	Respiratory illness in cystic fibrosis patients  Infections in lesions of burn patients	Found in many moist habitats and water  Source of infection may be humidifiers	Treatment is difficult; antibiotic resistant	Opportunistic pathogen
<b>Pseudomonas cepacia</b>	Resp. pathogen	Respiratory illness in cystic fibrosis patients	Found in many moist habitats and water  Common contaminant of saline solutions water  Source of infection may be humidifiers	Treatment is difficult; antibiotic resistant	Opportunistic pathogen  Able to multiply in <b>low nutrient</b> environment
<b>Haemophilus influenzae</b>	Invasive infections in young children	Meningitis, pneumonia, joint infections  Increased bronchial inflammation in patients with chronic bronchitis	Normal nasopharyngeal flora in many adults & children	Development of vaccine; now used routinely  Decreased number of cases in Canada	
<b>Cronobacter</b> (formerly enterobacter)	Nosocomial infections  Enterobacter sakazakii = infant illness from powdered formula	Wound infections, pneumonia, bacteremia	Hospitals  Powdered infant formula  Most common in low birth weight babies	Not discussed	Not discussed
<b>Helicobacter pylori</b>	Stomach ulcers	Stomach ulcers (prev. thought to be caused by stress & diet)	Not discussed	<b>Triple therapy treatment:</b> antibiotics & H <sup>+</sup> inhibitors	<b>Microaerophilic</b>  <b>Spiral bacilli</b>  Produces <b>urease</b> which creates a <b>high pH</b> environment; protects from low pH
<b>Bordetella</b>	Whooping	Violent cough	Inhalation	Vaccination	<b>4 virulence factors:</b>

<b>pertussis</b>	cough			w/ <b>heat-killed</b> organism	<ol style="list-style-type: none"> <li>1. Pertussis toxin (A-B)</li> <li>2. Extracytoplasmic adenylate cyclase (weakens host defense)</li> <li>3. Filamentous hemagglutinin (bronchial attachment and exotoxin release)</li> <li>4. Tracheal cytotoxin (destroys ciliated cells poor clearance of mucous and bacteria)</li> </ol>
<b>Legionella pneumophila</b>	Legionnaires disease	<p>Severe pneumonia</p> <p>Other lung problems</p>	<p><b>No</b> person-person transmission (very weird for an airborne pathogen!!!)</p> <p><b>Aerosol transmission</b></p> <p>Grows in <b>water</b>; found in shower heads, water tanks, air heating/cooling tanks</p>		<b>Opportunistic pathogen</b>

## WAXY COAT ACID-FAST BACILLI - MYCOBACTERIA

Causative agent of **tuberculosis & leprosy**

### Waxy coat

- **NO gram stain**, resistant to **disinfectants**

### Acid-fast

- Resistant to **decolorization**

Use **Ziehl-Neelsen** staining technique!

BACTERIA	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<b>Mycobacterium Tuberculosis</b>	TB!	<p><b>Primary TB:</b> cell mediated immunity; <b>chronic slow progressing</b></p> <ul style="list-style-type: none"> <li>&gt; Inhalation</li> <li>&gt; Multiplication in alveoli</li> <li>&gt; Cell-mediated immune response</li> <li>&gt; Lung infection</li> <li>&gt; Active CMI</li> <li>&gt; Infection stopped</li> <li>&gt; Reactivation years later</li> </ul> <p>Leading cause of death worldwide from a single infection</p> <p><b>Post-primary TB:</b> late reactivation of lesions in lungs, kidneys, bones, etc</p> <p>5% of cases; higher in AIDS patients</p> <p>Chronic infection</p>	Inhalation of <b>aerosol droplets</b>	<p><b>4-6 weeks</b> to see colonies on plate</p> <p>Lowenstein-Jensen medium</p> <p>Use <b>microscopy of sputum smears</b> as <b>first</b> line of diagnosis</p> <p><b>Mantoux test</b> Tuberculin solution injected <b>intradermally</b>; wait 48-72 hrs; check for <b>induration</b> (hard bump)</p> <p><b>Positive: &gt;10mm</b> Not necessarily active infection</p> <p><b>Doubtful: 5-9 mm</b> Likely reaction to other mycobacteria</p> <p><b>Negative: &lt;4mm</b></p> <p><b>ZN STAINING</b></p>	<p><b>Obligate aerobe</b></p> <p>Facultative <b>intracellular</b> parasite</p> <p>Infection develops in <b>stages</b> (see primary symptoms)</p> <p><b>Cell-mediated immunity</b></p>
<b>Mycobacterium Leprae</b>	Leprosy	<p><b>Tuberculoid Leprosy:</b> visible nerve enlargement; few <b>erythematous plaques</b> (can be mistaken for wine stains, etc); many</p>	<p><b>Tuberculoid:</b> low infectivity</p> <p><b>Lepromatous:</b> high infectivity; rarely found in developed countries</p>	<b>ZN STAINING</b>	Not discussed

		<b>lymphocytes &amp; granulomas</b>  <b>Lepromatous Leprosy:</b> no visible nerve enlargement; many <b>erythematous nodules</b> (boil-like, red patches, etc), <b>many bacilli</b> in infected tissue, nodules of NZ+ pus, disfiguring			
<b>ATYPICAL MYCOBACTERIA</b>	Most typically seen in <b>immunocompromised</b> patients				
<b>M. kansasii, M. avium, M. intracellulare</b>	Seen in chronic lung disease	Not discussed	Not discussed	Give <b>doubtful</b> mantoux test  Resistant to anti-TB drugs	<b>Indistinguishable</b> from TB  In <b>chronic lung disease</b> patients
<b>M. marinum</b>	n/a	<b>Skin infections</b>	Not discussed	Not discussed	Not discussed
<b>M. fortuitum</b>	n/a	<b>Soft tissue abscesses</b>	Not discussed	Not discussed	Not discussed

<b>SPIROCHETES (LONG SQUIGGLY THINGS)</b>					
<b>BACTERIA</b>	<b>DISEASE</b>	<b>SYMPTOMS</b>	<b>TRANSMISSION</b>	<b>DIAGNOSIS / TREATMENT</b>	<b>CHARACTERISTICS</b>
<b>Treponema Pallidum</b>	Syphilis	<b>Primary Syphilis:</b> appearance of <b>chancre</b> 3-4 weeks after infection  <b>Secondary Syphilis:</b> 5 weeks after chancre appears; generalized or local <b>rash</b> , mucosal <b>lesions</b> w/ many <b>treponemes</b> (bacteria)	<b>Contact</b> with infected <b>chancre</b>  Latent syphilis non-transmittable after <b>4 years</b> ; but <b>congenital</b> infection may occur	<b>Serological</b> testing;  <b>Non-treponemal</b> tests (VDRL, RPR, Wassermann): > non-specific > can't confirm diagnosis alone > positive in early stages  <b>Treponemal</b> tests > specific (use treponemal extracts)	Gram <b>negative</b>  <b>Helical</b> bacteria  Unculturable <b>in vivo</b>  <b>Dark field microscopy!!!</b>  Almost <b>invisible</b> under gram stain, geimsa stain, and ZN stain

		<p><b>Spontaneous remission may occur after stage 1 or 2</b></p> <p><b>Latent Syphilis:</b> no symptoms; congenital infection may occur</p> <p><b>Late Syphilis:</b> obliterative endarteritis (artery inflammation); can involve skin, mucosae, NS, cardiovascular sys, and tissues</p>		<p>&gt; FTA-ABS (fluorescent treponemal antibody absorption) &gt; MHA-TP (microhemagglutination of T. pallidum) &gt; used to confirm positive VDRL</p>	
<p><b>Borrelia Burgdorferi</b></p>	<p>Lyme Disease</p>	<p><b>Bullseye rash</b> (not necessarily where bite occurred)</p> <p>Affects skin, joints, NS, and heart</p>	<p>Bites by <b>infected</b> deer ticks</p> <p>Common in US, rare in Canada</p>	<p><b>Serology</b> for diagnosis (<b>ELISA</b>)</p> <p>No positive result in first <b>2-3 weeks</b> of infection</p> <p>Treat w/ antibiotics for <b>early</b> disease</p> <p><b>Prolonged treatment</b> for <b>neurological &amp; musculoskeletal</b> manifestations</p> <p>Vaccine available (<b>ospA antigen</b>)</p>	<p>Organism very <b>difficult to see</b> under microscope</p> <p>Difficult to culture</p>

**CHLAMYDIAE (COCCI);**

Obligate intracellular energy parasites; can **not** make their own **ATP/other energy** intermediates

Can **not** be grown on artificial media

**Life cycle** (2 forms):

- **Elementary body:** (300-400 nm)
  - Infectious form
  - No growth or replication
  - Sexually transmitted
- **Reticulate body:** (800-1000 nm)
  - Turns into reticulate body once it's been transmitted
  - Actual infection

BACTERIA	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<b>Chlamydia Trachomatis</b>	<p><b>STI Chlamydia</b></p> <p><b>Trachoma</b> (chronic ocular infection; leading cause of <b>blindness</b> in middle east, southeast asia, and north africa)</p> <p><b>Conjunctivitis in newborns</b> (perinatal transmission)</p> <p><b>Lymphogranuloma venereum</b> (STD from some serotypes; endemic in (sub)tropical countries)</p>	<p>Many patients <b>asymptomatic &amp; untreated</b></p> <p><b>Male:</b> urethritis <b>Untreated:</b> prostatitis, epididymitis</p> <p><b>Female:</b> cervicitis <b>Untreated:</b> PID, tubal infertility, ectopic pregnancy, chronic pelvic pain</p>	<p>Sexually transmitted</p> <p><b>Perinatal</b> (right before birth) transmission to newborns</p>	<p><b>Limited</b> diagnostic tools</p>	<p><b>Most common STI</b> in Canada and USA</p> <p><b>2 biovars:</b></p> <ul style="list-style-type: none"> <li>● Trachoma</li> <li>● Lymphogranuloma venereum</li> </ul> <p><b>Trachoma:</b> 15 serovars</p> <p><b>LGV:</b> 4 serovars</p>
<b>Chlamydia Pneumoniae</b>	Not discussed	<p>Mild pneumonia, respiratory tract infections</p> <p>Usually <b>subclinical</b></p>	Not discussed	Not discussed	Not v important! No real distinguishing features!
<b>Chlamydia Psittaci</b>	Not discussed	Pneumonia or endocarditis	<b>Bird pathogen</b>	Not discussed	Remember <b>birds!</b>

**MYCOPLASMA**Smallest **free-living** bacterium (100-300 nm)**Saprophytes** (eat organic material); part of normal flora of **oropharynx** & **genital tract** of humans & animals**No true cell wall**

Some species are pathogenic

BACTERIA	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<b>Mycoplasma Pneumoniae</b>	Primary cause of <b>atypical pneumonia</b>	<b>Primary</b> cause of atypical (free-walking) pneumonia *important  <b>Rarely</b> complications lead to meningoencephalitis or myocarditis	Person-person aerosol droplet inhalation	Usually <b>clinical</b>  No lab confirmation  Treat with erythromycin or tetracycline	More common in <b>younger</b> individuals (15-35 years)
<b>Genital Mycoplasma</b>  (mycoplasma hominis, ureaplasma urealyticum)	Not discussed	Urethritis, PID, and postpartum fever  Controversial role in premature birth and infertility	Colonization rates increase with <b>number of sexual partners</b>	Not discussed	Part of normal <b>genital</b> flora

**MYCOTIC (FUNGAL) INFECTIONS****Depth of infection** (skin to bloodstream)

- Superficial
- Cutaneous
- Subcutaneous (lymphatics)
- Systemic (bloodstream)

FUNGUS	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<b>Cryptococcus</b>	Not discussed	Not discussed	Not discussed	Not discussed	<b>Systemic</b> fungal infection  Associated with <b>AIDS</b> patients
<b>Aspergillus Flavus</b>	Not discussed	Not discussed	<b>Grain products</b>	Not discussed	Mycotoxin produced: <b>aflatoxin</b>

## PARASITES

Intimate & obligatory symbiotic relationship; parasite dependent on host

Short term (mosquito) or long term (tapeworm)

Very common (50% of animals are parasites)

**Host:** organism that is home/food source

**Intermediate host:** secondary home

**Vector:** how parasite gets from host to host (tick is vector for lyme disease)

**Success of parasite determined by:**

- Prevalence in host
- Number of host species available
- Geographic range
- Number of offspring
- Available routes of transmission

PARASITE	DISEASE	SYMPTOMS	TRANSMISSION	DIAGNOSIS / TREATMENT	CHARACTERISTICS
<b>Giardia Lamblia</b>	Acute giardiasis	<p>Most people are asymptomatic carriers</p> <p>Diarrhea, weight loss, abdominal discomfort, nausea, vomiting</p> <p>Retardation of growth and development in young children (failure to thrive); CNS issues</p>	<p><b>Fecal-oral</b> (resistant cysts)</p> <p>Most common in young children (more poop exposure)</p> <p>Can be <b>food</b> or <b>water</b> borne</p> <p>Travelers &amp; immuno-compromised at higher risk</p> <p>Much more common in <b>developing world</b></p> <p>Improvement of awareness and hygiene/ sanitation necessary</p>	<p><b>String test</b> (plastic nub on string swallowed, pulled back up throat, and tested for antigens)</p> <p><b>Microscopy: Stool exam</b> (cysts concentrated by flotation and identified using bright-field microscopy)</p> <p><b>Immunological testing: ELISA</b> Detection of <b>giardia-specific</b> antigens in stool</p> <p>Treated w/ <b>nitroimidazole</b> derivatives</p>	<p>Most frequently identified <b>intestinal</b> parasite in the world</p> <p><b>Protozoan</b> (single cell organism)</p> <p><b>Life cycle</b></p> <ul style="list-style-type: none"> <li>• Trophozoites in bowel become <b>cysts</b> that are shed in stool</li> </ul> <p><b>Chlorine-resistant</b> (water filtration)</p>
<b>Trichomonas Vaginalis</b>	Vaginitis trichomoniasis	<p>40-50% <b>asymptomatic</b> carriage</p> <p><b>Vaginitis;</b> itching, foul-smelling, sometimes frothy discharge</p> <p>May lead to</p>	<p><b>Mucous membrane</b> contact (no cyst shedding)</p>	<p><b>Microscopy</b> (wet mounts) to identify trichomonads in <b>vaginal</b> or <b>urethral</b> discharge</p> <p>Testing and treatment of</p>	<p>Possibly most common STI <b>worldwide</b></p> <p>No resistant cyst stage</p> <p>Vary greatly in size</p>

		<p><b>cervical cancer</b> and <b>HIV</b> infection</p> <p>Infection during pregnancy = <b>premature delivery / low birth weight</b></p> <p><b>Males</b> usually <b>asymptomatic</b>; occasionally urethritis/ prostatitis</p>		<p><b>partners</b> is necessary to avoid <b>reinfection</b></p> <p><b>Metronidazole &amp; tinidazole</b></p>	
<b>Entamoeba Histolytica</b>	Not discussed	<p>Typical infection of large intestine may be <b>asymptomatic</b> or result in <b>diarrhea/ constipation</b></p> <p><b>Amoebic dysentery</b> in some patients: <b>bloody/mucoid diarrhea!!!!</b></p> <p>May spread through <b>blood</b> to produce <b>liver, lung, or brain abscesses</b></p>	<p><b>Fecal-oral</b></p> <p>Person-person, contaminated water, raw produce, food handlers, flies</p> <p>Largely related to <b>poor sanitation &amp; hygiene</b></p> <p>Improvement of awareness and hygiene/ sanitation necessary</p> <p>Common in <b>tropical developing countries</b></p>	<p><b>Microscopic</b> identification of <b>trophozoites</b> or <b>cysts in feces</b> or <b>lesions</b></p> <p><b>Luminal amebicides</b> (act on organisms in intestinal lumen)</p> <p>For <b>symptomatic</b> intestinal disease or <b>extraintestinal</b> infections (liver, lung, brain): <b>metronidazole</b> or <b>tinidazole</b></p>	Not discussed
<b>Toxoplasma Gondii</b>	Toxoplasmosis	<p><b>Immunocompetent host:</b> 90% asymptomatic, lymphadenopathy, headaches, muscle aches, fever, malaise</p> <p><b>Immunocompromised host:</b> encephalitis (brain inflammation), myocarditis, pneumonia (AIDS-defining; indicates that patient has AIDS)</p>	<p><b>Ingestion</b> of sporulated <b>oocysts</b> (contaminated soil/sand, fruits/vegetables, waterborne outbreaks, cat poop)</p> <p><b>Ingestion</b> of <b>tissue cysts</b> (raw or poorly cooked meat)</p> <p><b>Congenital infection</b> of</p>	<p><b>Serological assays</b></p> <p>Immunocompetent patients don't usually require treatment</p> <p>Immunocompromised: require <b>prompt</b> treatment with <b>pyrimethamine &amp; sulfadiazine</b></p> <p>Congenital: mother/fetus can</p>	<p>Very high <b>seroprevalence</b> in humans worldwide</p> <p>Large number of mammal/bird <b>intermediate</b> hosts</p> <p>Cats only <b>definitive</b> hosts; shed <b>oocysts</b> in feces</p>

		<p><b>Congenital infection:</b> hepatosplenomegaly (liver/spleen swelling), mental retardation, retinochoroiditis (retinal inflammation), hydrocephalus (fluid in brain)</p>	<p>fetus; most severe if acquired in first trimester</p>	<p><b>both</b> be treated</p>	
<p><b>Plasmodium</b></p>	<p>Malaria</p>	<p><b>Spiking</b> fever &amp; chills</p> <p><b>Flu-like</b> symptoms (myalgias, headaches, abdominal pain, malaise)</p> <p><b>Severe</b> symptoms (p. falciparum): seizures, coma, renal failure, respiratory failure</p>	<p><b>Anopheline mosquitoes</b> (vectors)</p> <p><b>Blood transfusion / shared needles</b></p> <p><b>Congenital infection</b></p> <p>“Airport malaria”</p>	<p><b>Drug resistance</b> is a serious problem</p> <p><b>Chloroquine &amp; mefloquine</b></p> <p>Protect against mosquito bites (long sleeves, bug spray, bed nets)</p> <p><b>Mosquito eradication</b></p>	<p>Largely a <b>man-made</b> disease (forest clearing, irrigation canals)</p> <p>Drug-resistant in <b>Thailand</b></p>
<p><b>Crypto-Sporidium Parvum</b></p>	<p>Crypto-sporidiosis</p>	<p><b>Watery diarrhea</b> (most important symptom)</p> <p>Dehydration, weight loss, abdominal pain, fever, nausea, vomiting</p> <p>Chronic, debilitating, potentially <b>life-threatening</b> in immuno-compromised *remember!!!</p>	<p><b>WATER</b> (most important mode of transmission-contaminated drinking water) &gt; outbreaks associated w/ <b>water parks &amp; pools</b></p> <p><b>ZOONOTIC</b> (petting zoos&gt; <b>calves</b>)</p> <p><b>Person-person</b> (ingestion of oocysts due to poor hygiene)</p> <p><b>Autoinfection</b> (thin-walled oocysts released into lumen, causing infection) &gt; <b>responsible for fatal disease in immuno-</b></p>	<p><b>No drug treatment available!</b></p> <p><b>Microscopy</b> (intermittent oocyst shedding = multiple stool examinations)</p> <p>Wet-mounts or permanent stains (acid-fast)</p> <p><b>Immuno-fluorescence microscopy</b></p>	<p>Reported in humans <b>worldwide</b></p> <p><b>Life cycle:</b> complex; includes both <b>sexual &amp; asexual</b> phases (oocysts)</p> <p><b>Obligate intracellular protozoan</b></p> <p>Infects <b>intestinal epithelial</b> cells (typically <b>small intestine</b>)</p> <p><b>Acid-fast</b></p> <p><b>Water treatment</b> is important</p> <p><b>Public health education</b></p> <p>Drink <b>bottled water</b></p> <p>Oocysts die &gt;60°C</p>

			<b>compromised</b>		and <-20°C
<b>Cyclospora Cayetanensis</b>		<b>Profuse &amp; prolonged diarrhea</b>  Abdominal pain, nausea, vomiting, fatigue, loss of appetite	Person-person is <b>unlikely</b>  Zoonotic transmission is <b>unlikely</b>  <b>99% of cases are FOODBORNE</b>  <b>Direct contamination:</b> infected food handlers (poor hygiene)  <b>Indirect contamination:</b> contaminated irrigation water, mixing pesticides, etc	Treated with <b>bactrim</b>  <b>Microscopic examination of wet mount</b> stool for oocysts (bright field, differential interference contrast, auto-fluorescence)  <b>Staining methods</b> (acid fast)	<b>Coccidian protozoan</b>  <b>Low</b> infectious dose  <b>1 week</b> incubation period  <b>Endemic</b> in Nepal, Haiti, Peru, and Guatemala
<b>Enterobius Vermicularis (PINWORM)</b>	Pinworm	<b>Mild</b> infection of <b>cecum / colon</b>  May cause <b>pruritus ani</b> (itching) leading to disturbed sleep & irritability	<b>Eggs ingested</b> (fecal-oral)  Discourage itching, nail biting  Change bedding/ underwear often	<b>Anal itching</b> used as diagnostic characteristic  <b>Scotch tape test:</b> sticky surface used to collect egg sample from perianal area; microscopic adult female worms may be present  Treat with <b>pyrantel pamoate</b>	More of a <b>nuisance</b> than a health problem  Up to <b>50%</b> of children in north america get pinworm
<b>Trichinella</b> (spiralis & nativa)	Roundworm	<b>Larvae in small intestine:</b> diarrhea, abdominal pain, vomiting  <b>Larvae in muscle tissues:</b> facial edema, conjunctivitis,	<b>Larvae ingested</b> in raw or undercooked meat  <b>Rats</b> spread trichinella	<b>Intestinal phase:</b> thiabendazole  <b>Tissue phase:</b> mebendazole & albendazole  <b>Steroids:</b> reduce inflammation	<b>Small roundworm;</b> found worldwide in meat-eating animals  <b>Larvae:</b> encysted in striated muscle  <b>Adult:</b> small intestine  <b>2 Forms:</b>

		fever, myalgia  <b>Occasional life-threatening manifestations:</b> myocarditis, CNS involvement, pneumonitis			<b>Trichinella spiralis</b> (domestic form): humans, swine, <b>rats</b> , horses  <b>Trichinella nativa</b> (sylvatic/wild form): humans, bears, wolf, etc; <b>resistant to freezing</b>
<b>Ascaris Lumbricoides</b>	Most common intestinal worm (helminth)	<b>Asymptomatic</b> or <b>vague abdominal discomfort</b>  Vomiting and/or <b>obstruction</b> can occur	After shedding in <b>feces</b> , eggs mature and become infective after <b>several days</b>  Ingestion of <b>eggs</b> in soil, fruits/veg, or water  Associated with <b>poor sanitation</b>	<b>Microscopy:</b> stool examination for eggs  <b>Surgery</b> may be required to clear worm  Mebendazole, albendazole, or pyrantel pamoate	Large intestinal <b>nematode</b>  High prevalence <b>worldwide</b> (esp in <b>warm</b> regions)  Most common human <b>helminth</b> (worm)
<b>Anisakis Simplex</b>	Whale worm/ herring worm	Often <b>invasive</b> (penetrates <b>mucosa</b> )  Abdominal pain, nausea, vomiting	Home-prepared <b>sushi, sashimi, and ceviche</b>  <b>Definitive hosts:</b> dolphins, porpoises, whales  <b>First intermediate hosts:</b> marine crustaceans  <b>Second intermediate hosts:</b> salmon, mackerel, cod, herring, tuna, squid	Diagnosis is difficult; <b>no eggs in stool</b>  <b>Endoscopic &amp; radiologic</b> examinations  Often mistaken for <b>appendicitis</b> ; exploratory surgery may reveal <b>larvae</b>  <b>Drug treatment is ineffective</b>	Highly prevalent in <b>Japan</b>  Quite rare in North America  Humans are " <b>dead-end</b> " hosts  <b>cooking/freezing</b> very effective in killing organism
<b>Diphyllobothrium</b>	Broad fish tapeworm	Most cases are <b>asymptomatic</b>  Abdominal pain, dizziness, fatigue, vomiting, diarrhea/ constipation	<b>Ingestion</b> of raw or poorly cooked <b>freshwater</b> fish containing larvae	<b>Microscopy:</b> stool examination for <b>eggs</b> or <b>proglottids</b> (segments of worm)  <b>Anthelmintic</b>	Very large <b>tapeworm</b>  <b>Adult:</b> small intestine of humans & fish-eating mammals  <b>Larvae:</b> freshwater fish (intermediate hosts)

		<b>Vitamin B12</b> deficiency causing <b>pernicious anemia</b>		<b>drugs</b> are effective (praziquantel)	
<b>Taenia</b> (solius & saginata)	Beef/ pork tapeworm	Mild abdominal complaints  <b>T. solium neurocysticercosis:</b> infection w/ larval stage of T. solium; larvae <b>migrate</b> and develop in <b>brain</b> ; > intracranial hypertension, hydrocephalus, convulsive seizures	<b>Ingestion</b> of <b>larvae</b> in raw or poorly cooked meat	<b>Eggs</b> or <b>proglottids</b> in stool  <b>Serological</b> techniques  <b>Anthelmintic drugs</b>  <b>Surgery</b>	Adult stage found <b>only in humans</b>  <b>2 species</b> <ul style="list-style-type: none"> <li>• Taenia saginata (beef tapeworm); longer worm</li> <li>• Taenia solium (pork tapeworm)</li> </ul> <b>Both species are rare</b> in Canada  <b>Cooking</b> meat kills larvae
<b>Schistosoma</b> <b>(BLOOD FLUKE)</b>  (S. haematobium, S. japonicum, S. mansoni)	Schistosomiasis	Usually <b>asymptomatic</b> except in heavily infected patients  Rash, <b>itchiness</b> from penetrating larvae  Fever, lymphadenopathy, hepatosplenomegaly (swelling of lymph nodes, spleen, and liver)	<b>Free-swimming larvae</b> in fresh water <b>penetrate skin</b> and develop in blood vessels surrounding <b>intestine</b> or <b>bladder</b>	<b>Microscopy:</b> examination for eggs in <b>stool</b> or <b>urine</b>  Treated with praziquantel	<b>NOT GI LIKE OTHERS</b>  <b>Snails</b> are intermediate hosts  <b>3 main species:</b> <ul style="list-style-type: none"> <li>• S. haematobium</li> <li>• S. japonicum</li> <li>• S. mansoni</li> </ul> Avoid contact with water in <b>endemic</b> areas
