

# Lecture 9

## Loops

A. Panchapakesan<sup>1</sup>

<sup>1</sup>Department of Computer Science  
University of Ottawa

Introduction to Computing 1, Fall 2017

## 1 Recap

- For-loops
- List Slicing
- Memory Model

## 2 Modifying Within a For-Loop

- Deleting
- Adding

## 3 While Loops

- Deleting from a List
- Adding to a List
- Definition

# Outline

## 1 Recap

- For-loops
- List Slicing
- Memory Model

## 2 Modifying Within a For-Loop

- Deleting
- Adding

## 3 While Loops

- Deleting from a List
- Adding to a List
- Definition

# Outline

## 1 Recap

- For-loops
- List Slicing
- Memory Model

## 2 Modifying Within a For-Loop

- Deleting
- Adding

## 3 While Loops

- Deleting from a List
- Adding to a List
- Definition

# For-loops

What does this code print?

```
L = [1,2,3,4,5]
for i in L:
    print(i)
```

# For-loops

Poll on Echo360

- The numbers 1 through 5
- The list [1,2,3,4,5]
- The list [1,2,3,4,5], five times

# Outline

## 1 Recap

- For-loops
- **List Slicing**
- Memory Model

## 2 Modifying Within a For-Loop

- Deleting
- Adding

## 3 While Loops

- Deleting from a List
- Adding to a List
- Definition

# List Slicing

What does this code print?

```
L = [1,2,3,4,5,6]
print(L[::-2])
```

# List Slicing

Poll on Echo360

- [6, 4, 2]
- [1, 3, 5]
- [5, 3, 1]
- [2, 4, 6]

# Outline

## 1 Recap

- For-loops
- List Slicing
- **Memory Model**

## 2 Modifying Within a For-Loop

- Deleting
- Adding

## 3 While Loops

- Deleting from a List
- Adding to a List
- Definition

# Memory Model

Consider this code

```
t = ([1,2,3], 5)
t[0][0] = 'a'
```

# Memory Model

What happens when we run that code?

- `t` becomes `(['a', 2, 3], 5)`
- It blows up because tuples are immutable
- Something else

# Outline

- 1 Recap
  - For-loops
  - List Slicing
  - Memory Model
- 2 Modifying Within a For-Loop
  - Deleting
  - Adding
- 3 While Loops
  - Deleting from a List
  - Adding to a List
  - Definition

# Outline

- 1 Recap
  - For-loops
  - List Slicing
  - Memory Model
- 2 **Modifying Within a For-Loop**
  - **Deleting**
  - Adding
- 3 While Loops
  - Deleting from a List
  - Adding to a List
  - Definition

# Consider This Code

It removes all 3s from a list

```
L = ['a', 2, 3, 3, 4, 5, 6, 2, 3, 5, 3]
for i in L:
    if i == 3:
        L.remove(i)
```

# What is L now?

Poll on Echo360

- ['a', 2, 4, 5, 6, 2, 5]
- Something else

# A Closer Look at That Code

```
L = ['a', 2, 3, 3, 4, 5, 6, 2, 3, 5, 3]
for i in L:
    print(i)
    if i == 3:
        L.remove(i)
```

# What's Happening There?

Let's look at the visualizer

- When you delete from a list, in-place
  - the iterator doesn't change
  - it knows the current index, and then goes to the next index ( $\text{index}+1$ )

# What's Happening There?

Let's look at the visualizer

- When you delete from a list, in-place
  - the iterator doesn't change
  - it knows the current index, and then goes to the next index (index+1)

# What's Happening There?

Let's look at the visualizer

- When you delete from a list, in-place
  - the iterator doesn't change
  - it knows the current index, and then goes to the next index (index+1)

# Outline

- 1 Recap
  - For-loops
  - List Slicing
  - Memory Model
- 2 **Modifying Within a For-Loop**
  - Deleting
  - **Adding**
- 3 While Loops
  - Deleting from a List
  - Adding to a List
  - Definition

# Let's Change that Code Slightly

Don't actually run this code

Let's look at the visualizer

```
L = [1,2,3]
for i in L:
    L.append(i**2)
```

# Outline

- 1 Recap
  - For-loops
  - List Slicing
  - Memory Model
- 2 Modifying Within a For-Loop
  - Deleting
  - Adding
- 3 While Loops
  - Deleting from a List
  - Adding to a List
  - Definition

# Outline

- 1 Recap
  - For-loops
  - List Slicing
  - Memory Model
- 2 Modifying Within a For-Loop
  - Deleting
  - Adding
- 3 While Loops
  - Deleting from a List
  - Adding to a List
  - Definition

# A For-loop Couldn't do this

```
L = ['a', 2, 3, 3, 4, 5, 6, 2, 3, 5, 3]
while 3 in L:
    L.remove(3)
```

# That was the Easy Way

But we're ninjas, so let's try another way

```
L = ['a', 2, 3, 3, 4, 5, 6, 2, 3, 5, 3]
i = 0
while i < len(L):
    print("i is", i, "and L[i] is", L[i])
    if L[i] == 3:
        L.pop(i)
    else:
        i += 1
```

# So What Did that For-loop Do?

```
L = ['a', 2, 3, 3, 4, 5, 6, 2, 3, 5, 3]
i = 0
while i < len(L):
    print("i is", i, "and L[i] is", L[i])
    if L[i] == 3:
        L.pop(i)
    i += 1
```

# Outline

  - **Adding to a List**
  - Definition

# Adding to a List

Don't actually run this code

Let's look at the visualizer

```
L = [1,2,3]
i = 0
while i < len(L):
    L.append(L[i]**2)
```

# Define `while`

- `while <condition>`
- Keep executing the body
  - until the condition is `False`
- If the condition is never `False`
  - execute the body infinitely (infinite loop)
- If the condition is never `True`
  - never execute the body
- Python does not have a `do-while` (but Java does)

# Define while

# Collatz Conjecture

THE COLLATZ CONJECTURE STATES THAT IF YOU PICK A NUMBER, AND IF IT'S EVEN DIVIDE IT BY TWO AND IF IT'S ODD MULTIPLY IT BY THREE AND ADD ONE, AND YOU REPEAT THIS PROCEDURE LONG

# Collatz Conjecture

- Pick a number
- If it's even
  - divide it by 2
- If it's odd
  - multiply by 3, and add 1
- Eventually, you'll reach 1
- No known proof
  - [https://en.wikipedia.org/wiki/Collatz\\_conjecture](https://en.wikipedia.org/wiki/Collatz_conjecture)

# Collatz Conjecture

# Coding the Collatz Conjecture

```
n = 97
while n != 1:
    if not n%2: # n is even
        n //= 2
    else: # n is odd
        n = n*3 + 1
print(n)
```
