[3] **1.** Find the derivative directly from the definition for the function $f(x) = \dfrac{1}{x+2}$. You must use the definition, not some other method.

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h}$$

$$= \lim_{h\to 0} \frac{\frac{1}{(x+h)+2} - \frac{1}{x+2}}{h}$$

$$= \lim_{h\to 0} \frac{\frac{x+2}{(x+h+2)(x+2)} - \frac{(x+h+2)}{(x+h+2)(x+2)}}{h}$$

$$= \lim_{h\to 0} \frac{x+2-x-h-2}{(x+h+2)(x+2)(h)}$$

$$= \lim_{h\to 0} \frac{-\cancel{h}}{(x+h+2)(x+2)(\cancel{h})}$$

$$= \lim_{h\to 0} \frac{-1}{(x+h+2)(x+2)}$$

$$= \frac{-1}{(x+0+2)(x+2)}$$

$$= -\frac{1}{(x+2)^2}$$

[6] **2.** Find the derivative of each function.

a) $f(x) = \sin(\ln(x^2))$

$$f'(x) = \cos(\ln(x^2))\left(\frac{1}{x^2}\right)(2x)$$

b) $g(t) = t^{\ln(t)}$

$$\ln(g(t)) = \ln(t^{\ln(t)})$$

$$\Rightarrow \ln(g(t)) = \ln(t)\ln(t)$$

$$\Rightarrow \frac{1}{g(t)} \cdot g'(t) = \frac{1}{t}\ln(t) + \ln(t)\cdot\frac{1}{t}$$

$$\Rightarrow g'(t) = g(t)\left[\frac{1}{t}\ln(t) + \ln(t)\cdot\frac{1}{t}\right]$$

$$\Rightarrow g'(t) = \left(t^{\ln(t)}\right)\cdot\left[\frac{2\ln(t)}{t}\right]$$

[3] **3.** Estimate the value of $f(0.1)$ using a linearization of $f(x) = \tan(x) + 1$. Choose the point a of the linearization appropriately.

$$L(x) = f(a) + f'(a)(x-a)$$

Let $a = 0$.

$f(x) = \tan(x) + 1$ $\qquad$ $f(0) = \tan(0) + 1 = 0 + 1 = 1$

$f'(x) = \sec^2(x)$ $\qquad$ $f'(0) = \sec^2(0) = \frac{1}{(\cos(0))^2} = \frac{1}{1^2} = 1$

$$\therefore L(x) = 1 + 1(x-0) = 1 + x$$

By FTC 1,

$$\frac{d}{dx}\left(\int_3^{x^2} \frac{1/2}{1+t}dt + \int_{\tan^{-1}(x)}^{2} \tan(t)\,dt\right)$$

[6] **5.** Consider the curve defined by $y + xe^y = x^2$.

a) Give $\frac{\mathrm{d}y}{\mathrm{d}x}$ in terms of x and y.

$$y + xe^y = x^2$$

$$\Rightarrow \frac{dy}{dx} + 1 \cdot e^y + x \cdot e^y \cdot \frac{dy}{dx} = 2x$$

$$\Rightarrow \frac{dy}{dx} + x \cdot e^y \cdot \frac{dy}{dx} = 2x - e^y$$

$$\Rightarrow \frac{dy}{dx}(1 + xe^y) = 2x - e^y$$

$$\Rightarrow \frac{dy}{dx} = \frac{2x - e^y}{1 + xe^y}$$

b) Find all values of x such that the point $(x, 0)$ is on the curve defined by the above equation. For each of these give the slope of the tangent line to the curve at that point.

$y + xe^y = x^2$ at $(x,0)$ $y = 0$

$$\Rightarrow 0 + xe^0 = x^2$$

$$\Rightarrow x = x^2$$

$$\Rightarrow 0 = x^2 - x$$

$$\Rightarrow 0 = x(x-1)$$

$x = 0$ $x = 1$

at $(0,0)$, slope $= \frac{dy}{dx} = \frac{2(0) - e^0}{1 + (0)e^0} = -1$

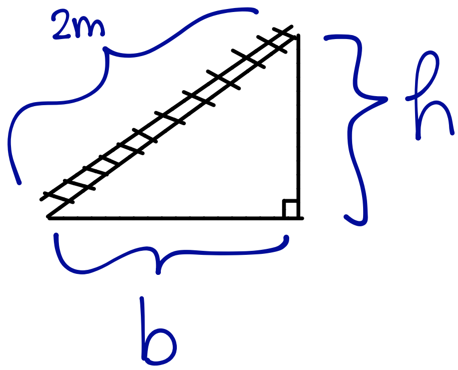
[4] **7.** A ladder of length 2m is leaning against wall. The top of the ladder slides vertically down the wall while the bottom slides horizontally directly away from the wall.

When the bottom of the ladder is 1m from the wall and moving at 0.1m/s, how fast is the top of the ladder falling?



when $b = 1\text{m}$ and $\frac{db}{dt} = 0.1\ \text{m/s}$ what is $\frac{dh}{dt}$?

eq. $b^2 + h^2 = 2^2$ $\Longrightarrow$ $h = \sqrt{2^2 - b^2}$

when $b=1$, $h = \sqrt{2^2 - 1^2} = \sqrt{3}$ m

$\Longrightarrow 2b \cdot \frac{db}{dt} + 2h \cdot \frac{dh}{dt} = 0$

$\Longrightarrow 2(1)(0.1) + 2(\sqrt{3}) \cdot \frac{dh}{dt}$

$\Longrightarrow \frac{dh}{dt} = \frac{-2(1)(0.1)}{2\sqrt{3}} = -\frac{0.1}{\sqrt{3}}$ m/s

$\therefore$ the top of the ladder is falling at a rate of $\frac{0.1}{\sqrt{3}}$ m/s.

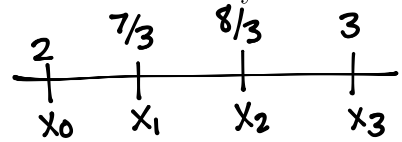
a) Give an expression for the Riemann sum for $\int_2^3 \ln(x)\,\mathrm{d}x$ using $n = 3$ rectangles and the right-hand rule. You do not need to evaluate your expression numerically.

$f(x) = \frac{1}{x}$ interval $[2,3]$ $n=3$ $\Delta x = \frac{3-2}{3} = \frac{1}{3}$



$$R_3 = \sum_{i=1}^{3} f(x_i)\Delta x = \left(f(7/3) + f(8/3) + f(3)\right)\left(\frac{1}{3}\right)$$

Give an expression for the value of n required so that Simpsons's method applied to $\int_2^3 \ln(x)\,\mathrm{d}x$ is accurate to within 0.00001. You do not need to compute Simpson's method, nor evaluate your expression numerically. An expression for n suffices.

$f(x) = \ln(x) \Rightarrow f'(x) = \frac{1}{x} = x^{-1} \Rightarrow f''(x) = -x^{-2} \Rightarrow f'''(x) = 2x^{-3} \Rightarrow f^{(4)}(x) = \frac{-6}{x^3}$

on $[2,3]$ $\left|f^{(4)}(x)\right| = \left|\frac{-6}{x^3}\right| = \frac{6}{x^3} \le \frac{6}{1^3}$ since $\frac{6}{x^3}$ is decreasing on $[2,3]$

$\Rightarrow$ we can use $K=6$ in the error bound.

We want n such that $\frac{K(b-a)^5}{180n^4} \le 0.00001$

$$\Rightarrow \frac{6(3-2)^5}{180n^4} \le 0.00001$$
