

## Branching Control Instruction

---

- So far in the bodies of our algorithms, we have used:
  - a simple statement
  - a straight sequence of simple statements
- Sometimes, we need more than a straight sequence in our solutions, as we sometimes need to do different computations depending on certain conditions.
- **Branching** instruction (condition)!

140

## Problem: Larger of Two Numbers

---

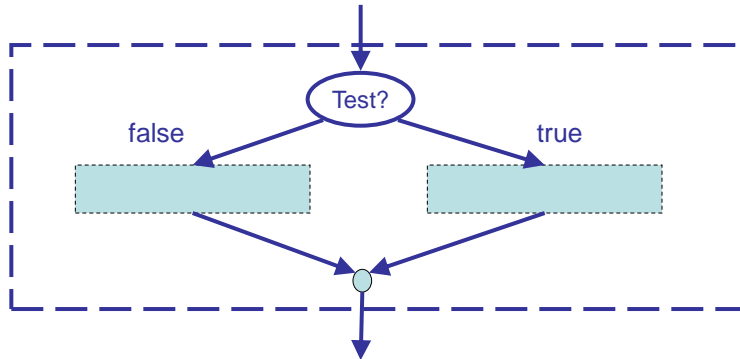

- Write an algorithm to compute the larger of two given numbers.

GIVENS:            x, y                    (two numbers)  
RESULT:            m                            (the larger of x and y)  
HEADER:            m  $\leftarrow$  max2(x, y)

- We will represent this with a Branching Control Instruction

141

## Branching Control Instruction

- The shaded boxes are **INSTRUCTION BLOCKS**.
- Note that the branch instruction is complex and can contain many other instructions within its instruction blocks.
  - Graphical representation in our software models!

142

## Algorithm Model Diagrams

- Provides visual description of algorithms.
- Composed of nodes connected with arrows.
- Test node:
  - Represents the testing of a condition (Boolean expression with question mark)

- Instruction block :
  - Indicates where another instruction block can be inserted. The instruction block can contain simple or complex instructions (and even no instructions at all)

143

## Contents of Instruction Blocks

---

- Simple instruction (call, assignment)
- Empty statement ( $\emptyset$  = "do nothing")
- Branching control instruction
- Loop control instruction (coming soon...)
- **Important:** Each block has exactly one entrance (one arrow in) and one exit (one arrow out).

144

### Exercise 5-1 - Back to the Larger of Two Numbers

- 
- How would the algorithm for finding the larger ( $\max$ ) of two values  $x$  and  $y$  be written in a model diagram ?

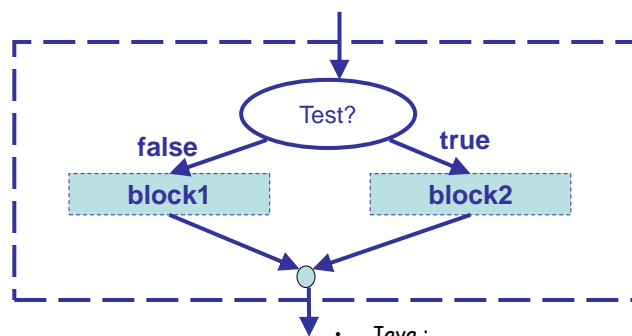

145

## Exercise 5-2 - Maximum of 3 numbers ?

- Given three numbers  $x$ ,  $y$ , and  $z$ , find the maximum of the three values.
  - Version 1: nested tests
  - Version 2: sequence of tests

146

## Translating Branches to Java

• Java :

```
if (test)
{
    // Instructions
}
else
{
    // Instructions
}
```

Instruction block 2 {

Instruction block 1 {

147

# Java if Instruction - Option

The else part of the instruction is optional. Thus in algorithms use only the empty statement block in the false part of the if statement.

```
if (test)
{
    // Instructions
}
else
{
    // Instructions
}
```

```
if (test)
{
    // Instructions
}
```

148

## Exercise 5-3 - Translating Branches ?

Givens:  $x, y, z$  (three numbers)

Result:  $m$  (the largest given value)

Header:  $m \leftarrow \max_3(x, y, z)$

- Two solutions:
  - sequence of branch instructions
  - nested branch instructions
- Translate the latter into Java:

149

# Nested Branches

---

150

Exercise 5-4 - Translation of  
Nested Branches

---

?

151

## Example of an instruction block with a branch instruction

---

152

## Exercise 5-5 - Translation of an Instruction Block

---

153

## Tracing algorithms with branching

---

- When tracing an algorithm with tests (branches or loops)
  - Number the tests as well as the statements
  - Include a row in the trace indicating which test is being done and whether it is true or false.
  - Indicate only the instructions executed in the trace.

154

### Exercise 5-6 - Trace of Maximum of 3 numbers

---

Trace:  $\text{max3}(5, 11, 8)$

155

## Exercise 5-7 - Movie Tickets

- 
- Calculate the amount to charge for a person's movie ticket given that the charge is \$7 for a person 16 or under, \$5 for a person 65 or older, and \$10 for anyone else.
    - Version 1: nested tests
    - Version 2: sequence of tests

156

## Boolean Variables

- 
- A **Boolean variable** is one which can have only 2 possible values: **TRUE** or **FALSE**.
    - In reality represented by two values (e.g. 0 and 1), but in high level language use only these key words are allowed!
  - An assignment statement is used to put a value into a Boolean variable, e.g.,
    - `x ← TRUE`
    - `y ← FALSE`
  - The outcome of a test (Boolean expression) can be assigned to a Boolean variable:
    - `x ← (a < 0)`

157

## Exercise 5-8 - Positive Value

- 
- Write an algorithm which checks if a given number  $x$  is positive.

158

## Compound Boolean Expressions

- 
- A compound Boolean expression consists of two or more Boolean expressions connected by operators AND and/or OR.
  - **Exercise 5-9** - Write a compound Boolean expression that is true if a given age is between 16 and 65 (not including 16 or 65) and false otherwise.

159

# Truth Tables

- A **TRUTH TABLE** for a compound Boolean expression shows the results for all possible combinations of the simple expressions:

x	y	x AND y	x OR y
TRUE	TRUE		
TRUE	FALSE		
FALSE	TRUE		
FALSE	FALSE		

160

# Operator NOT

x	NOT x
TRUE	FALSE
FALSE	TRUE

- NOT is an operator to negate the value of a simple or compound Boolean expression:
- Example. Suppose age = 15. Then:
  - Expression age > 16 has a value FALSE, and NOT (age > 16) has a value TRUE.
  - Expression age < 65 has a value TRUE, and NOT (age < 65) has a value FALSE.

161

## Exercise 5-10 More Compound Boolean Expressions

Suppose  $x = 5$  and  $y = 10$ .

Expression	Value
$(x > 0) \text{ AND } (\text{NOT } (y = 0))$	
$(x > 0) \text{ AND } ((x < y) \text{ OR } (y = 0))$	
$(\text{NOT } (x > 0)) \text{ OR } ((x < y) \text{ AND } (y = 0))$	
$\text{NOT } ((x > 0) \text{ OR } ((x < y) \text{ AND } (y = 0)))$	

162

## Expressions in Tests

- The TEST in a Branch or Loop may be any Boolean expression:
  - Boolean variable
  - Negation of a Boolean expression
    - NOT (Java: `!`)
  - Comparison between two values
    - Java operators: `==` `!=` `<` `>` `<=` `>=`
    - The **data** being compared may not necessarily be **boolean**, but the **result** of the comparison is **boolean**
  - Join two Boolean expressions
    - AND (Java: `&&`)
    - OR (Java: `||`)
- Watch out for
  - confusing `=` with `==`
  - confusing AND with OR
- e.g. test if  $x$  is in the range 12..20:
  - `(x >= 12) && (x <= 20)`

163
