Horizontal asymptote

Vertical asymptote

Slant / oblique asymptote.

$$f(x) = \frac{a(x)}{b(x)}, \quad \deg a(x) = m, \quad \deg b(x) = n, \quad m > n$$

Typical situation when we get slant asymptotes.

$$\text{Eg). } y = \frac{(1-x)^3}{x^2} = \frac{-x^3 + 3x^2 - 3x + 1}{x^2}$$

$$= (3-x) + \left(\frac{1-3x}{x^2}\right)$$

$$\text{long division: } x^2 \overline{) \begin{array}{r} -x^3 + 3x^2 - 3x + 1 \\ -x^3 \\ \hline 3x^2 - 3x + 1 \end{array}} \quad \begin{array}{l} \text{remainder} \\ \downarrow \end{array}$$

$$\begin{array}{r} 3x^2 \\ 3x^2 \\ \hline 0 \end{array}$$

Simplify it

$$f(x) = (3-x) + \left(\frac{1-3x}{x^2}\right); \quad \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \underbrace{(3-x)}_{\text{linear}} + 0$$

 $y = (3-x)$  gives the slant asymptote.
