

**GNG1103 – Engineering Design**  
**GNG1503 – Génie de la conception**  
**Conceptual Design/Ideation**

Presented by: Emmanuel Bouendeu

[http://www.e-arc.in/wp-content/uploads/2016/06/e-arc-conceptual\\_design\\_artwork.jpg](http://www.e-arc.in/wp-content/uploads/2016/06/e-arc-conceptual_design_artwork.jpg)

**Faculté de génie | Faculty of Engineering**

**uOttawa.ca**

# Agenda

- Quiz 2
- Reminders
- **Review Questions**
- **Generality on Ideas Generation**
- **Documentation Tools for Conceptual Design**
  - Free-Hand Sketching
  - Block diagrams
- **Brainstorming as Ideation Tool**
- **Concepts Generation for du [Ski-Hill Rescue Device](#) Case Study**

# Reminders

- **Lab 4 (Project):** [This week](#)
- **Project Deliverable C (Design Criteria):** [Feb. 02](#)
- **Project Deliverable D (Conceptual Design):** [Feb. 09](#)
- **Project Plan (Week 4,6,8,10):** [Weekly review & update](#)
- **Peer Feedback & Team Dynamics 1:** [Feb. 16](#)
- What is your summary of **Lecture 7**?
  - Steps of the conflict resolution process
  - Types of conflict and Sources of conflict
  - Possible conflict management styles
  - Factors determining the choice of the appropriate style
  - Best style in conflict management

# Review Questions

1. What is **ideation** in engineering design?
2. List and describe **two documentation tools** used in engineering design?
3. Using the **important** design criteria of your course project, produce at least **three preliminary design concepts** that could address your problem statement.
4. In the table below, indicate whether the statements are true or false.

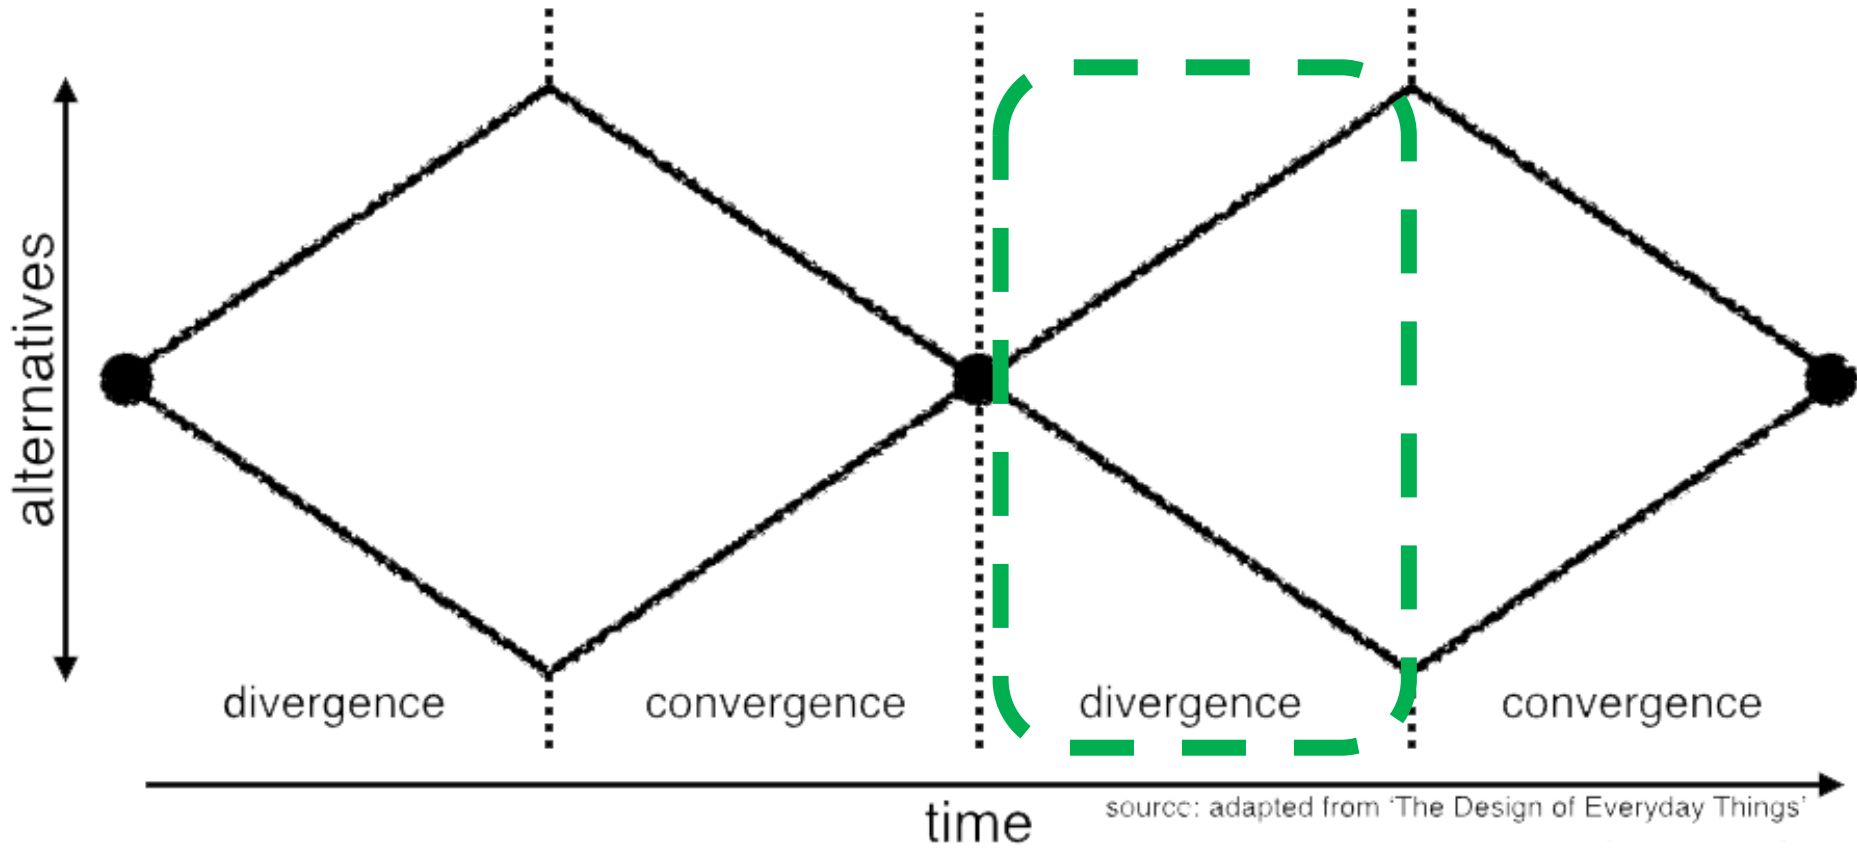

#	Statement	True/False
1	Finding the right solution in engineering design is only a convergent process.	
2	During the brainstorming session, judgements shall be suspended	
3	Brainstorming in engineering design means generate ideas, suspend judgements and formalize framework.	
4	Conceptualization does not involve analysis and choice of a concept.	

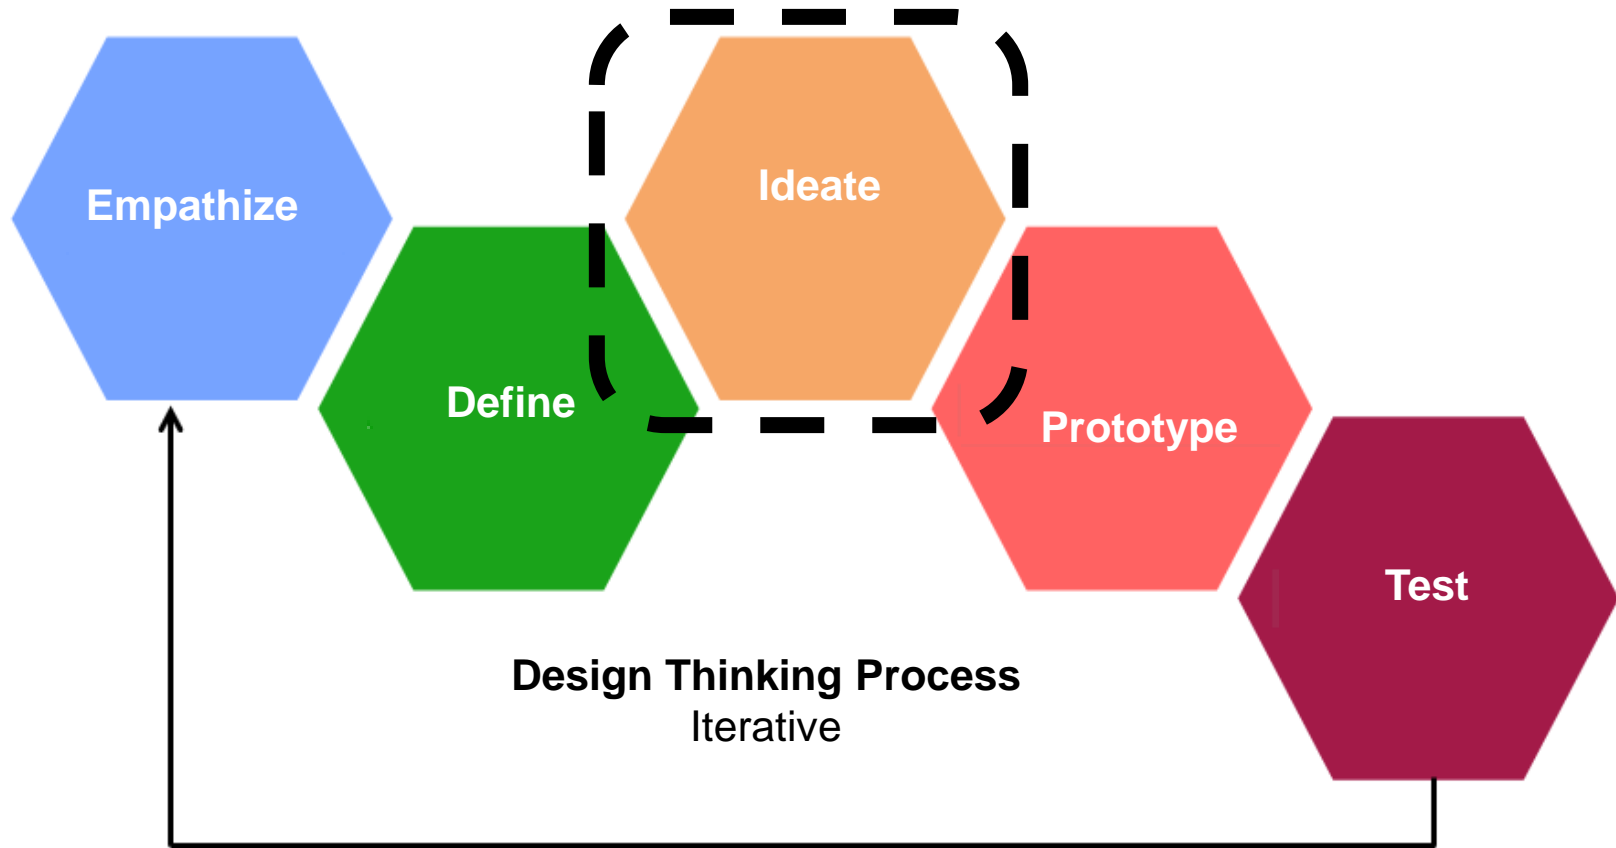

# Concept Generation

Finding the Right  
**PROBLEM**

Finding the Right  
**SOLUTION**

# Design Thinking Process

# Concept Generation

- This is the **creative** phase of the design process
  - **Many** preliminary ideas and concepts are generated
- It is a **divergent** phase where many possibilities are considered **without judgment**
- For a typical design project:
  - **At least three** conceptual design alternatives should be generated
  - These concepts should be well documented using **sketches** and **descriptions**
- There is **no formula** or set of rules to generate ideas! Rather, a set of **practical strategies** to:
  - Help designers **enhance their inherent creativity**
  - Facilitate the generation of **new ideas**

# Freehand Sketching

- Usually, **freehand sketching** is used to **explore**, **study** and **communicate** these design concepts
- The “**BEST**” **design engineers** can immediately communicate an idea via a **freehand sketch**
- **Simple:** all you need is a **paper and pencil**. Don't use **templates and compasses**. They will slow you down!

# Freehand Sketching

- Although quick, sketches are **planned**
- **Visualize** the sketch
  - Size of paper & scale
  - Orientation of the object
  - **Minimum** detail to **communicate** the idea

- Type of sketch

- Isometric
- Oblique
- Orthographic

Isometric

Oblique

Orthographic  
Projection

# Types of Sketches

- **Multi-View** (orthographic)
  - **Advantage:** true faces
  - **Disadvantage:** hard to visualize
- **Isometric** (a type of axonometric drawing) & **Perspective**
  - **Advantage:** easy to visualize the object
  - **Disadvantage:** no true face
- **Oblique**
  - **Advantage:** one true face
  - **Disadvantage:** not “photorealistic”

# Freehand Sketching

- Fundamental rule of sketching: maintain **proportions**
- Hint: use standard techniques to draw lines and arcs

- Lines

- Locate a **start** “dot”
- Locate an **end** “dot”
- Put pencil on start dot, **keep eyes on end dot** and smoothly move pencil toward the end dot (always **pull**, never **push**)

- Circles (arcs)

- Draw **light horizontal** and **vertical lines** that **intersect at the center**
- Lightly mark the radius on the lines
- Connect the radius marks with arcs to complete the circle (adapt the natural radius of your wrist and hand)

# Construction Lines

- Light and thin lines (barely visible)
- Serve as **paths** for final straight lines
- **Intersection** of construction lines specify the length of the final lines
- Points marked by the intersection of construction lines serve as **guides for sketching of arcs and circles**
- Guide the **proportions** of the sketch

## Construction lines

## Oblique sketching

# Block Diagrams

- System components (software code, electrical systems, etc.) can be represented by “blocks” in block diagrams:

- Many systems are hierarchical (i.e. composed of **multiple subsystems**)
- Systems must have at least **one input** variable and at least **one output** variable

# Block Diagrams

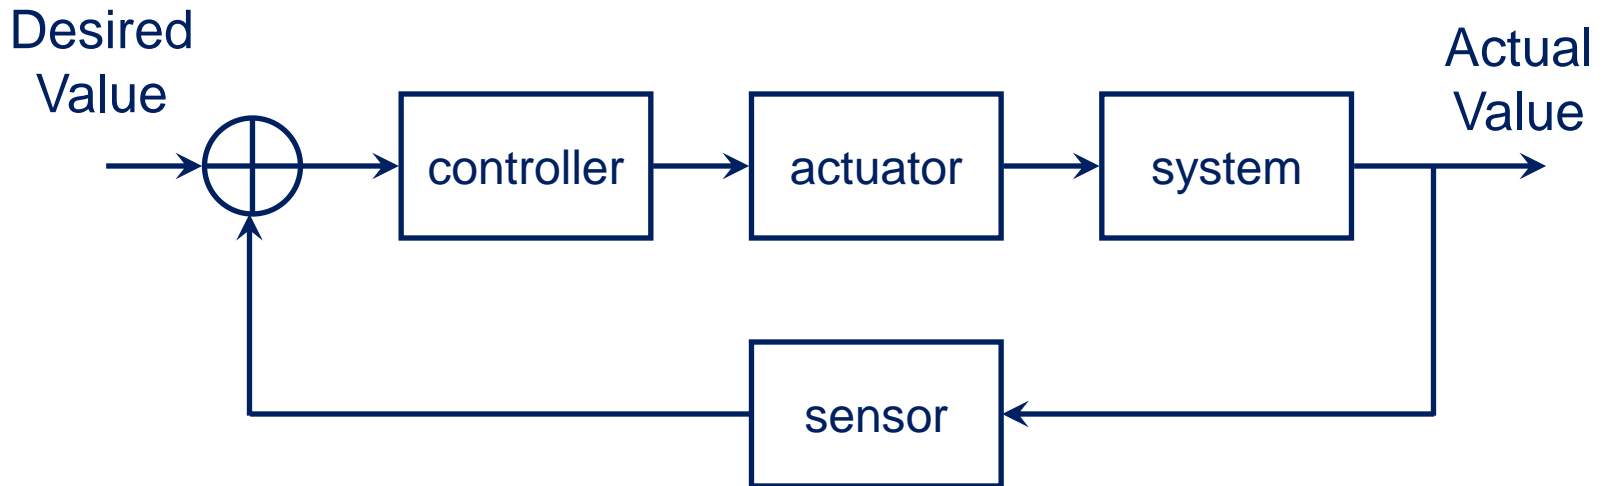

The objectives of a block diagram are:

- To provide an understanding of **signal flows** in the system (i.e. inputs and outputs of subsystems)
- To enable **modelling of complex systems** from simple **building blocks**
- To allow us to generate the overall **system transfer function** (i.e. how do we get from the input to the output)

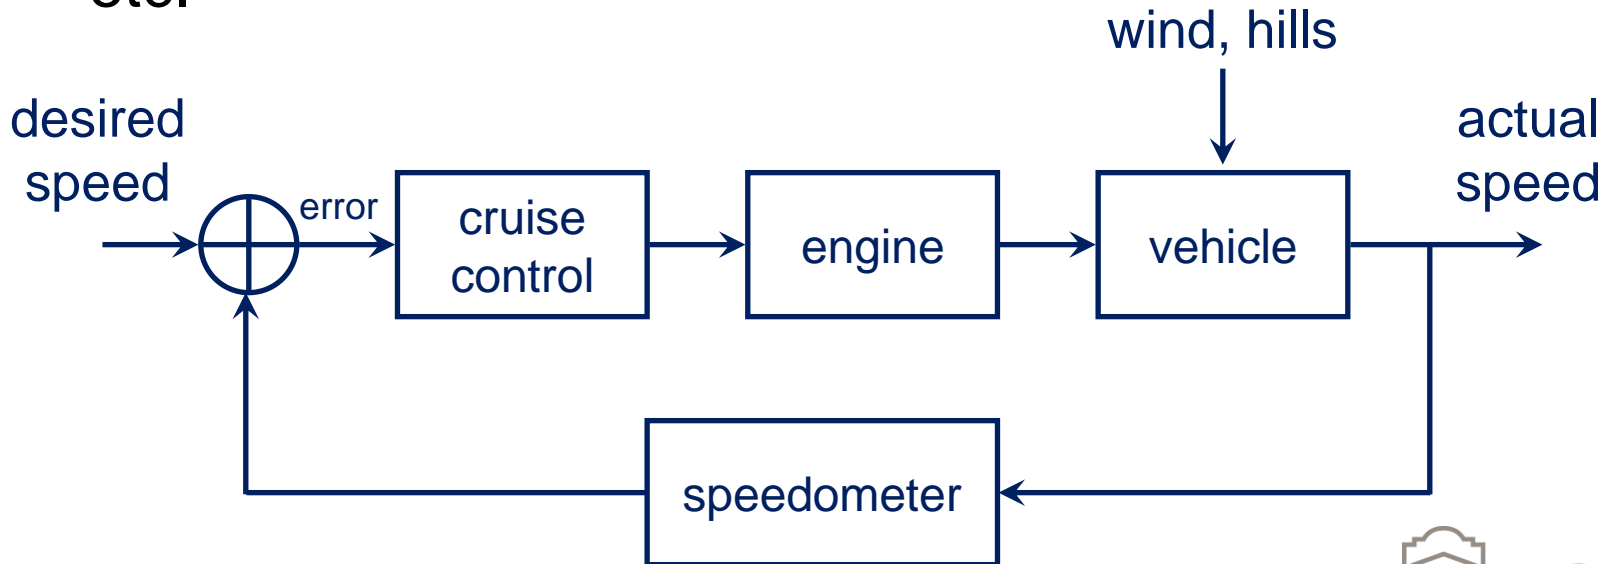

# General Feedback Control System

- This is a general model and can vary significantly depending on the control system

# Example 1: Vehicle Cruise Control System

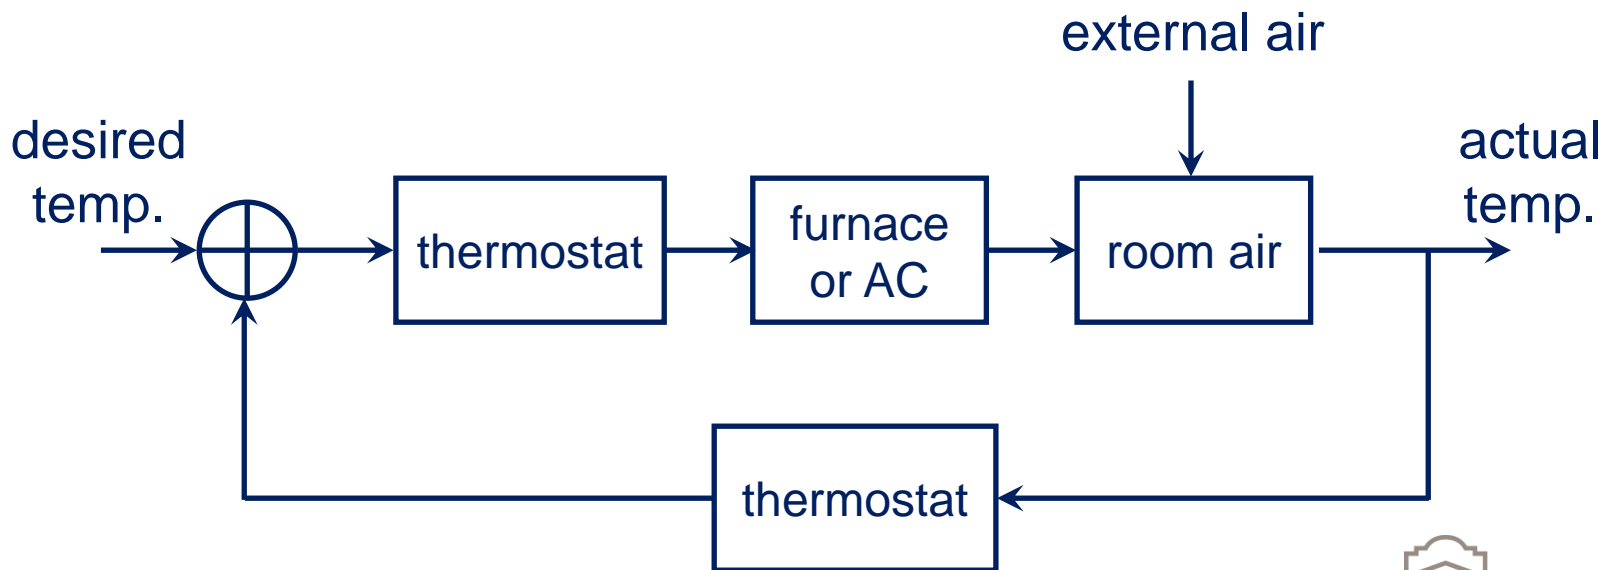

- **Input:** desired speed
- **Output:** actual speed
- **Error:** desired speed minus measured speed
- **Disturbance:** wind, hills, etc.
- **Controller:** cruise control unit
- **Actuator:** engine
- **System:** vehicle dynamics
- **Sensor:** speedometer

## Example 2: Thermostat

- Set thermostat to desired room temperature
- Thermostat measures room temperature
- Furnace or AC turns on if measured  $T^\circ$  is  $<$  or  $>$  then desired
- Air from furnace or AC changes room air temperature

# Generating Ideas: Brainstorming Process

1. Define and agree on the objective
2. Brainstorm ideas and suggestions having agreed on a time limit
3. Categorize/condense/combine/refine
4. Analyze and assess effects or results
5. Prioritize/rank options as appropriate
6. Agree on actions and timescale
7. Control and monitor follow-up

# How To Brainstorm Ideas and Suggestions

- Cross stimulation
  - **Provocation** is supplied by the **ideas of others** , *amplifying* the number of ideas that will be generated
- Suspended judgment
  - **No attempt** is made at **evaluating ideas** during brain storming sessions. Avoid remarks such as:
    - “that would not work because..”
    - “It is well known that...”
- Formality of setting
  - The **more formal** the session, the higher the chance of success
  - Having defined roles also helps

# Format For Group Brainstorming

- Time: **20 minutes**
- The **Chairman's** job is to:
  - **Guide** the session **without controlling it**
  - Ensure that only one person speaks at a time
  - **Stop** people who **evaluate** or **criticize** the ideas of others
  - **Define the central problem** and keep pulling people back to it
  - End the session when time runs out or when people get bored
  - **Organize** the listing and evaluation of ideas
- The **Note-taker's** job is to **record** all the ideas (crazy or not ... crazy is a *good* thing!) during the session into a **permanent list**

# Course Attendance: Registration

- Use your smartphone or laptop to **register/notify** your attendance in this lecture
- Allow **geo location** in the attendance site
- Accept **cookies** from third parties applications
- Log in using only your **Uottawa** account at the link below  
<https://attendance.azarm.ca/attendancerecord/gng1103f>
- Your attendance must be registered only **during the lecture** and at the **time specified by the professor**
- You can also use the **QR code** below, to register quickly

# CONCEPTUAL DESIGN

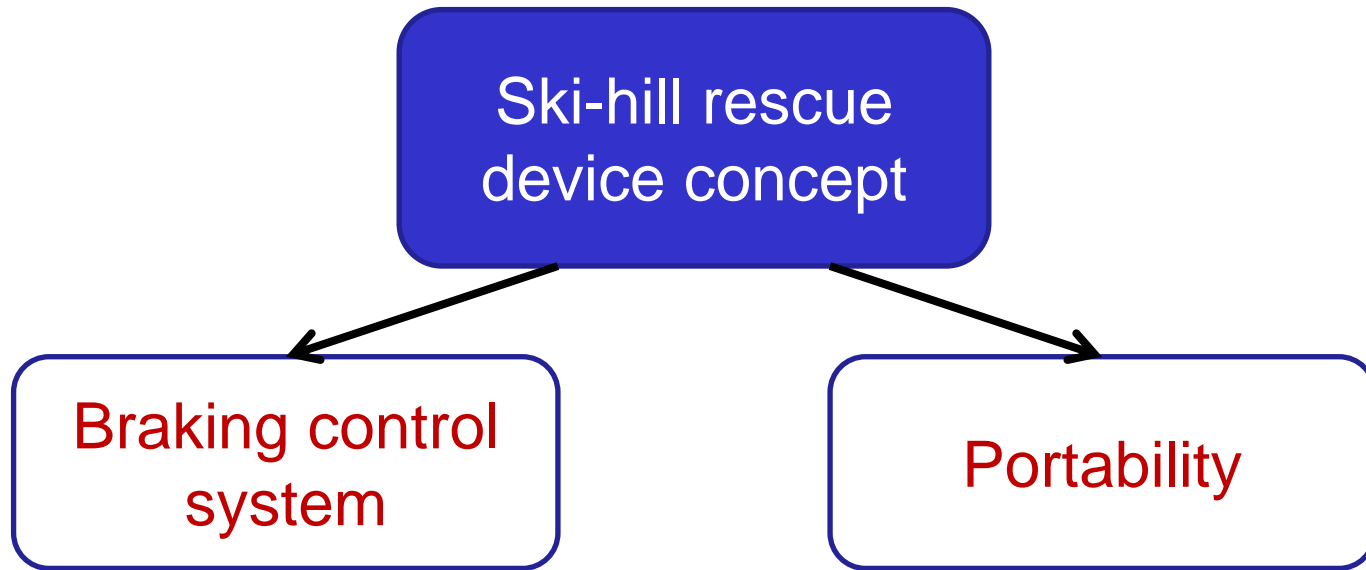

## Ski-Hill Rescue Device

WCDE 00395-03

# Conceptual Design

- Based on a few *important* design criteria:

- Braking surface
- Braking control method
- Parking brake
- Allows easy transport
- Minimum size when stored

# Conceptual Design For Ski-Hill Rescue Device

- **Braking and control:**
  - **Braking surface:** the component which contacts the snow to slow and/or stop the device's motion
  - **Braking control method:** the method by which the brake is engaged so that the braking surface can contact the snow
  - **Parking brake:** as an additional safety measure, it is desirable to incorporate a parking brake in the design
- **Portability:**
  - To allow for **easy transport** of the device **when required**
  - **When not in use**, the device should occupy the **least amount of volume** possible
  - The design should allow for a **fast setup** (assembly)

# Activity: Brainstorming For Conceptual Design

- Divide yourselves into groups of 3-5 people
- Brainstorm conceptual design ideas for one of the three elements of the **braking system** or for the **portability**

# Individual Brainstorming (5min)

- Each group member **silently** and **independently** generates a list of conceptual designs for either of the three parts of the **braking system** or the **portability**

# Group Brainstorming (10min)

- Free for all brainstorming session: each member of the team **takes their turn** to present concepts

- Important:** team members **cannot argue the merit of ideas** at this stage of brainstorming (just capture them!)

# Choosing Conceptual Designs (5min)

- Categorize/condense/combine/refine/reconsider
- Analyze and assess effects or results
- Prioritize/rank options as appropriate
- Choose Conceptual Designs (in this case 3 of them!)

# Share Your Solutions

# Braking Surface 1: Claw Brake Surface

Module 03, Figure 1

## ***Features:***

Perpendicular action, gradient braking with deeper penetration

# Braking Surface 2: Friction Brake Surface

Module 03, Figure 2

## ***Features:***

Large Friction surface, gradient braking with down force

# Braking Surface 3: Wedged Blade Brake

Module 03, Figure 3

## ***Features:***

Snow plough, gradient braking by angling inwards

# Brake Control 1: Lever Brake Engaging Method

Module 03, Figure 4

## ***Features:***

Bicycle-style cable control

# Brake Control 2: Handle Brake Engaging Method

Module 03, Figure 5

## **Features:**

Handle positions lever-style braking

# Parking Brake: Parking Spike

Module 03, Figure 6

## **Features:**

Parking brake for loading purposes

# Portability 1: Hinge Connection Portability

Module 03, Figure 7

## **Features:**

Folding for assembly or storage (Q: how much smaller?)

# Portability 2: Sliding Tub Sections

Module 03, Figure 8

## **Features:**

Sliding sections for storage or transport (Q: practical in snow?)

# Portability 3: Tether Portability

Module 03, Figure 9

## **Features:**

Tent pole-style tether allows more freedom of motion

# Portability 4: Snap-Together Portability

Module 03, Figure 10

## **Features:**

Allows arbitrary stored shapes (Q: Assembly time required?)

Q: Issues with lost or dropped pieces? Q: Assembly difficulty?)

# Portability 5: Roll-Up Portability

Module 03, Figure 11

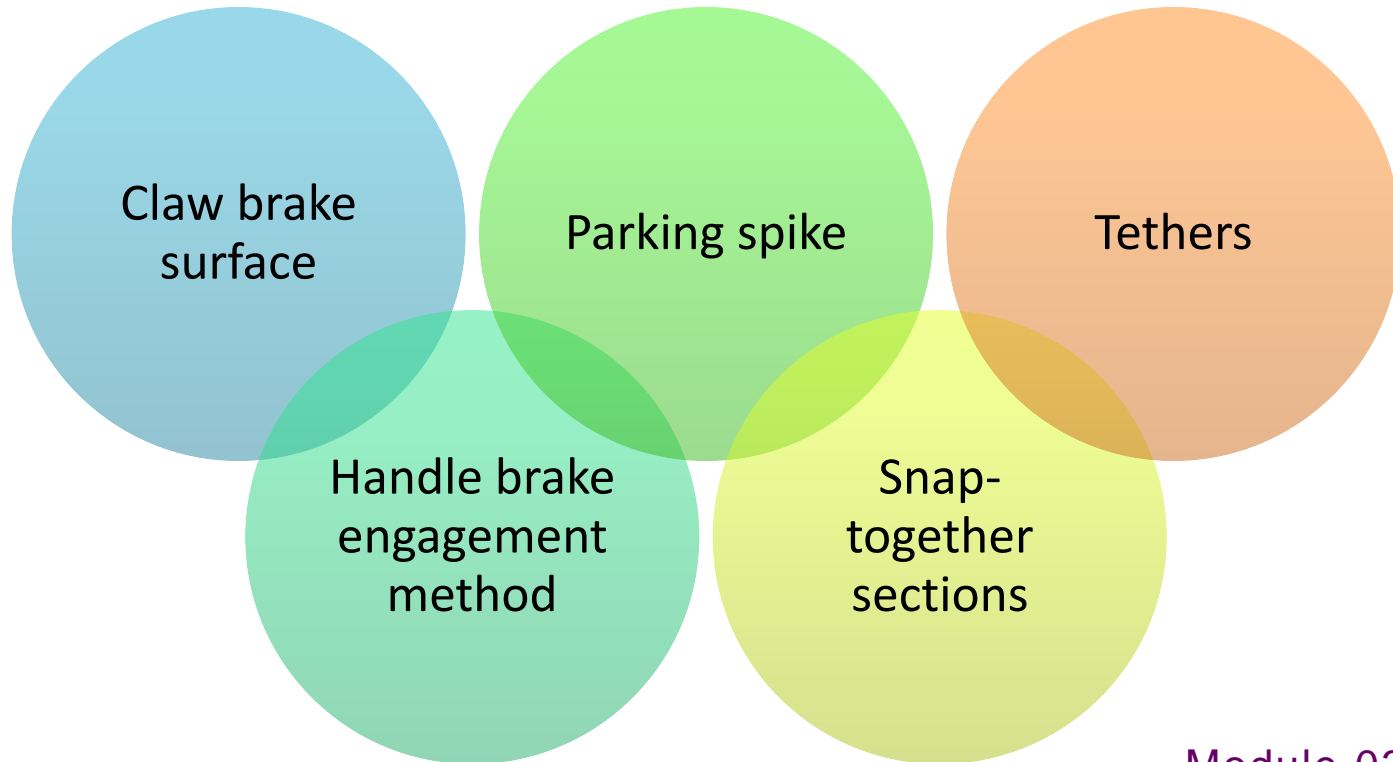

## **Features:**

Roll-up for transport (Q: How? Inflatable? Requires electricity?)

# Selected Conceptual Designs For the Ski-Hill Rescue Device

Module 03, Figure 12

# Selected Conceptual Design Rationale

- Design team selected the **claw** as the best option for further investigation and design
  - Concerns regarding the ability of the **friction concept** to slow and/or stop the device (low coefficient of friction of snow)
  - **Wedged blade** system would likely be more complicated to design
  - **Claw** provides the most braking force and is also simple
- Gradient braking
  - Both (**Lever**, **handle**) could provide a similar amount of control
  - Cables may get jammed or become loose in snow
  - Operator restrictions on holding position (i.e. not the cable itself)
  - Using the **handle** position to actuate the braking surface is simpler, in terms of number of components. Allows hand placement anywhere
